Nutritional value and pharmacological importance of citrus species grown in Iraq

Dr Ali Esmail Al-Snafi
Department of Pharmacology, College of Medicine, Thi qar University, Iraq

Abstract:- Citrus fruits contained many phytochemicals including essential oils, alkaloids, flavonoids, coumarins, psoralens, carotenoids with a wide range of nutritional components including vitamins, minerals and trace elements. The previous pharmacological studies revealed that citrus fruits possessed antimicrobial, anthelmintic, insect repellent, antioxidant, anticancer, cardiovascular, central nervous, anti-inflammatory, analgesic, anti-diabetic, reproductive, gastrointestinal, immunological, respiratory and many other pharmacological effects. This review was designed to highlight the chemical constituents, nutritional value and pharmacological activities of citrus fruits.

Keywords: constituents, nutritiona, pharmacology, citrus fruits, Citrus aurantifolia, Citrus medica, Citrus medica var. limetta, Citrus sinensis

Introduction
Medicinal plants are the Nature’s gift to human beings to help them pursue a disease-free healthy life. Plants are a valuable source of a wide range of secondary metabolites, which are used as pharmaceuticals, agrochemicals, flavours, fragrances, colours, biopesticides and food additives. Citrus contained nutrients and phytochemicals that were beneficial for health. Citrus fruits and juices contain a wide range of substances including carbohydrates, fibre, vitamin C, potassium, folate, calcium, thiamine, niacin, vitamin B6, vitamin A, phosphorus, magnesium, copper, riboflavin, pantothenic acid and a variety of phytochemicals. These substances are necessary for proper functioning of the body but some confer additional protection against chronic disease and basic nutrition. Citrus fruits are also low in fat and in overall dietary energy – a major consideration given the increasing rate of obesity in both adults and children. It also has a relatively low glycaemic index which helps in maintaining a more stable blood glucose level and generally healthier carbohydrate metabolism. Citrus fruits also contained many phytochemicals including essential oils, alkaloids, flavonoids, coumarins, psoralens and carotenoids. The previous pharmacological studies revealed that citrus fruits possessed antimicrobial, anthelmintic, insect repellent, antioxidant, anticancer, cardiovascular, central nervous, anti-inflammatory, analgesic, anti-diabetic, reproductive, gastrointestinal, immunological, respiratory and many other pharmacological effects. This review will highlight the chemical constituents, nutritional value and pharmacological activities of citrus fruits.

Plants profile:
Synonyms:
Any botanical classification of citrus fruit faces several difficulties. All citrus types hybridise easily. New hybrids are continuously developed to obtain desired qualities such as seedlessness, juiciness and fresh taste. New hybrids spontaneously arise by cross-pollination. The most modern methods of molecular research are sometimes needed to distinguish citrus types from each other. However, the synonyms of citrus species were:

Citrus aurantifolia

**Citrus limonum**

**Citrus medica**

**Citrus medica var. limetta**

It is a synonym of *Citrus medica* L.

**Citrus sinensis**

**Taxonomic classification:**

Common names 53:

**Citrus aurantifolia:**

Arabic: laimon helo; Chinese: lai meng; English: Egyptian lime. Indian lime. Key lime, lime, Mexican lime, sour lime, lime; French: citron vert, citronnier gallet, lime acid, limettier, limettier des Antilles, limettier mexicain; German: Limette, Limettenbaum, Limone, saure Limette; Italian: kagi ni mboo, kagi ni mbaru; Italian: lima; Portuguese: limão-galego, limão-tahiti; Spanish: limón agrio, limón ceutí, lima, lima mejicana, limero.

**Citrus limonum**

Arabic: laimon hamidhi; Chinese: li meng, ning meng; English: lemon; French: Citronnier, lemonier; German: Zitrone; Italian: limone; Portuguese: Limão, limoeiro-azedo, limão-eureka, limão-gênova, limão-siciliano, limão-verdadeiro, limoeiro, Spanish: limón, limonero.

**Citrus medica**

Arabic: Raranj, Trunj; Chinese: fo shou gan, xiang yuan; English: Buddha’s-Hand, citron, etrog citron, finger citron flesh-finger citron, small citron; French: cédrat, cédratier, main de Bouddha, sarcodactyle; German: Buddhafinger, gefingerte Zitrone, medischer Apfel, Zitronätzitrone; Italian: cedrato; Japanese: bushukan; Portuguese: cidra, cidreira; Spanish: cidro; toronja; Swedish: etrogcitron, fingercitron, suckatcitron.

**Citrus medica var. limetta**

Arabic: noomi helo, laimon helo; English: Mediterranean limetta, Mediterranean lumia, Mediterranean sweet lemon, Sweet lemon, Sweet lime; French: Limette à mameion, Limette d’Italie, Limette douce de Tunisie, Limettier à fruits doux, Limettier doux, Limonette; German: Süße Zitrone; Italian: Limetta, Limetta, dolce.
romana Limoncella patriarca; **Japanese**: Suiito remon, Rimetta, Rimetta oodineeru. **Portuguese**: Lima de bico; **Spanish**: Limeta dulce de Túnez, Limón dulce, Limonero dulce.

**Citrus sinensis**

**Arabic**: Burtaqal; **Chinese**: tian cheng  **English**: blood orange, navel orange, orange, sweet orange, Valencia orange; **French**: Navel, orange douce, orangier, orangier doux, sanguine; **German**: Apfelsine, Apfelsinenbaum, Orange, Orangenbaum; **Italian**: arancio dolce; **Portuguese**: laranja-doce, laranjeira, laranjeira-doce, laranja-amarga, laranja-azeda, laranja-bigrade, laranja-da- terra, laranja -de-sevilha; **Spanish**: naranja, naranjo duce.

**Distribution:**

The primitive center of origin of citrus species has been a subject of speculation and discussion for some time. The most recent research indicates an origin in Australia, New Caledonia and New Guinea. Some researchers believe that the origin is in the part of Southeast Asia bordered by Northeast India, Burma (Myanmar) and the Yunnan province of China[3-4]. Now, a worldwide cultivation and high-demand production for citrus fruit make it stand high among fruit crops. Growth of the citrus industry, including rapid development of the processing technology of frozen concentrated orange juice after World War II, has greatly expanded with international trade and steadily increased consumption of citrus fruits and their products during the past several decades. Because of distinct aroma and delicious taste, citrus fruits have been recognized as an important food and integrated as part of our daily diet, playing key roles in supplying energy and nutrients and in health promotion. Citrus fruits are characterized by low protein and very little fat content, citrus fruits supply mainly carbohydrates, such as sucrose, glucose, and fructose. Fresh citrus fruits are also a good source of dietary fiber, which is associated with gastrointestinal disease prevention and lowered circulating cholesterol. In addition to vitamin C, which is the most abundant nutrient, the fruits are a source of B vitamins (thiamin, pyridoxine, niacin, riboflavin, pantothentic acid, and folate), and contribute phytochemicals such as carotenoids, flavonoids, and limonoids. These biological constituents are of vital importance in human health improvement due to their antioxidant properties, ability to be converted to vitamin A (for example, β-cryptoxanthin), and purported protection from various chronic diseases. All these characteristics enhanced worldwide citrus fruit cultivation[5].

**Traditional uses:**

**Citrus aurantifolia**

*Citrus aurantifolia* was used traditionally as a laxative, appetizer, stomachic, digestive, anthelmintic, dyspepsia, flatulence and helmenthiasis.[55] *Citrus aurantifolia* was also used for cold fevers, sore throats, sinusitis and bronchitis, as well as helping asthma. Its oil is mainly used as antidepressant because it promoted refreshment to the tide mind. It can be helpful for rheumatism arthritis, obesity and has an astringent and toning action to clear oily skin and acne, in the treatment of herpes, cuts and insect bites[56-57].

**Citrus limonum**

Lemon juice is widely known as diuretic, antiscorbutic, astringent, and febrifuge. In Italy, the sweetened juice is given to relieve gingivitis, stomatitis, and inflammation of the tongue. Lemon juice in hot water has been widely advocated as a daily laxative and preventive of the common cold, but daily doses have been found to erode the enamel of the teeth. Prolonged use will reduce the teeth to the level of the gums. Lemon juice and honey, or lemon juice with salt or ginger, is taken as a cold remedy[58].

**Citrus medica**

In traditional medicine, ripe fruits were used in sore throat, cough, asthma, thirst, hiccough, earache, nausea, vomiting, anti scorbutic, stomachic, tonic, stimulant, expellant of poison, correct fetid breath; distilled water of the fruit was sedative, fruits and seeds were cardiac tonic and used in palpitation, fruit decoction is analgesic. Roots, flowers, seeds, peels and leaves were used in many ailments. The fruit wrapped in cloth was used to protect clothes from moths indicating its insect repellent activity. In ancient literature, citron was mentioned as an antidote for various kinds of poison[59-62].

**Citrus medica var limetta**

*Citrus medica var limetta* fruit and leaves were used for healing of common cold, control of blood lipids, for the treatment of fever, regulation of inflammatory and digestive disorders and as a blood pressure modulator[63-64].

**Citrus sinensis**

Oranges were eaten to allay fever and catarrh. The roasted pulp was prepared as a poultice for skin diseases. An infusion of the immature fruit was taken to relieve stomach and intestinal complaints. The flowers were employed medicinally by the Chinese people living in Malaya. Orange flower water, made in Italy and
France as antispasmodic and sedative. A decoction of the dried leaves and flowers was given in Italy as an antispasmodic, cardiac sedative, antiemetic, digestive and remedy for flatulence. The inner bark, macerated and infused in wine, was taken as a tonic and carminative. Decoction of husked orange seeds was prescribed for urinary ailments in China and the juice of fresh orange leaves or a decoction of the dried leaves was taken as a carminative or emmenagogue or applied on sores and ulcers. An orange seed extract was given as a treatment for malaria in Ecuador but it was known to cause respiratory depression and a strong contraction of the spleen\(^{(5,8,65)}\).

**Description:**

Tree growth and form varies depending on the species and genetic background and whether the tree was established by seed or grafting. Trees produced from seed tend to have more thorns and upright branch growth than trees produced from grafting. Flowers are 2–4 cm (0.8–1.6 in) in diameter, axillary, fragrant, single, few or cymose, and often perfect (having both functional stamens and pistils) or stamineate. The calyx is 4–5 lobed and there are usually five petals with oil glands. Stamens number between 20 and 40. Petal colors range from white to pinkish in Kafr lime to purplish externally in citron and reddish in lemon varieties. The subglobose ovary is superior, with 8–18 locules (cavities), with 4–8 ovules per locule in two rows.

Leaves are entire, 4 to 8 cm (1.6–3.2 in) in length, unifoliolate, fairly thick, with winged petioles. Leaves are ovate, oval or elliptical, with acute to obtuse tips, and glands containing oils in glands, which are released when crushed. Young twigs are angled in cross-section, green, and axillary single-spined, while older twigs and branches are circular in cross-section and spineless.

The fruit is a hesperidium, a fleshy, indehiscent berry that ranges widely in size, color, shape, and juice quality. Citrus fruit range in size from 4 cm (1.6 in) for lime to over 25 cm (10 in) in diameter for pummelo. Fruits are globose to ovoid in shape. The fleshy endocarp is divided into 10–14 sections containing the stalked pulp and separated by thin septa. Each section contains pulp (juice vesicles) that contains a sour or sweetish watery juice.

Seeds are pale whitish to greenish, fattened, and angular. The seeds are usually polyembryonic, meaning they have multiple embryos that can germinate. The embryos are either (zygotic) or (nicellar). The zygotic embryos are derived from pollination of the ovary, sexual reproduction. The nucellar embryos are derived wholly from the mother plant and display similar characteristics to the parent plant\(^{(66,68)}\).

**Chemical constituents:**

Citrus essential oils were obtained from the citrus fruits peel’s sacks. They were used by the food industry to give flavor to drinks and foods. They were also used in the pharmaceutical industry for the preparation of drugs, soaps, perfumes and other cosmetics as well as for home cleaning products\(^{(69,70)}\). The pericarp (rind) of *Citrus aurantifolia* contained 7 percent essential oil. The major compounds were D-limonene, D-dihydrocarvone, verbena, β-linalool, α-terpinol, trans-α-bergamotene, citral, fenchon, as well as terpineol, bisabolene, and other terpenoids\(^{(71,72)}\). However, a total of 46 compounds were identified from the *Citrus aurantifolia* oil. Most of these were terpenes, which were found in greater amounts than sesquiterpenes, aldehydes, ketones, phenols, and free acids. Alcohols and some terpenes show higher percentage areas in the maturity stages. D-limonene showed a concentration level higher than 70%, followed by bergamol (8%), β-pinene (7.62%), linalool (2.89%), α-pinene (0.82%). The isolated compounds were included, α-Pinene, Camphene, β-Pinene, Sabine, β-Myrcene, d-Limonene, Nonanal, (Z) Sabinene hydrate, Nonan, Undecan, Linalool, Camphor, Bergamol, Trans-α-bergamotene, Aromadendrene, Terpinen-4-ol, Epi-β-santalene, Trans-sabinene hydrate, Farnesol, Isopinocarveol, Terpineol acetate, α-Terpineol, Neryl acetate, Neral, Geranyl acetate, Geraniol, Citral, Cyclohexene-1, -methanol 4-1 methyl ester, Octal cyclopentene, cis-Myrtanol, Perillal, 2-Tridecene-1-ol, 3-Cyclohexlen-1-ol, Cyclohexyl-dodecane, Bicyclo(2,2,1) Heptane, 2,2-diethyl-3-methyl P-menth-1-en-8-ol, β-Bisabolol, Carveol, α-Farnesene, α-Bisabolol, β-Farnesene, Trans-β-santalol, α-Santalol, Isopropyl palmitate, β-Santalene and Cyclopropamethanol\(^{(73)}\).

Constituents of leaf essential oil of *Citrus medica* L. and their percentage were:

- Limonene 18.36, 7-Octabicyclo[4.1.0] heptane, 1-methyl-4-(1-methylthlenylethyl)- 1.18, 6-Octen, 3,7-dimethy- 4.39 Cyclohexane, 2-methyl-5-(1-methylthlenylethyl)- 2.24, 1-Monomolinoyleylglycerol trimethylisilyl ether 0.86, 6-Octen-1-ol, 3,7-dimethy- 1.72, n-pentyl(1-propenyl)dimethysilane 0.82, citral 12.95, 2-Octen-1-ol, 3,7-dimethy- , isobutyrate, (Z)- 1.10, 2-Oxocycloheptyl acetate 0.87, 2,4-Dodecadienoic acid, 11- methoxy-3,7,11-trimethyl- , methyl ester, (E,E)- 1.22, Methoprene 3.51, Geranyl methyl ether 1.42, 13-Heptadecyn-1-ol 1.05, 1,2-Cyclohexadienol, 1-methyl-4-(1-methylthlenylethyl)- 3.98, 2,6-Octadien-1-ol, 3,7-dimethy- , acetate, (Z)- 5.23, Mehp 8.96, 3,7-Nonadien-2-ol, 4,8-dimethy- 1.16, Eruylamide 28.43. While, the constituents of peel essential oil of *Citrus medica* L. and their percentage were: (1R)-2,6,6-
Nutritional and pharmacological importance of citrus species

Trimethylbicyclo[3.1.1]hept-2-ene 0.14, α-Pinene 0.41, 3-Octyn-2-ol 0.10, β-Myrcene 2.70, 2-Acetyl-5-methylfuran 0.05, Cyclooctyl alcohol 0.17, Limonene 21.78, Isolimonene 39.37, 1,3,6-Octatriene, 3,7-dimethyl- (Z)- 0.43, 1-Heptanol, 3-methyl- 0.04, Linalool 0.94, Nonanal 0.25, trans-p-Menth-2,8-dienol 0.04, 7-Oxabicyclo[4.1.0]heptane, 1-methyl-4-(1-methylethenyl)- 0.41, citral 23.12, 6-Octenal, 3,7-dimethyl-0.29, cis-Verbenol 0.09, Carane, 4,5-epoxy-, trans 0.30, 1,2-Cyclohexadienol, 1-methyl-4-(1-methylthyl)-0.03, 4-Terpineol 0.08, Terpinyl acetate 0.16, β-Terpineyl acetate 0.52, Decanal 0.33, Neryl acetate 2.51, Neryl Alcohol 2.25, Undecanal 0.10, Neryl acetate 0.60, Dodecanal 0.08, (Z,E)-α-Farnesene 0.05, Caryophyllene 0.59, α-Bergamotene 0.48, 1,6,10-Dodecatriene, 7,11-dimethyl-3-methylene-, (Z)- 0.04, Tetralin(trimethylsiloxy)silane 0.04, α-Caryophyllene 0.08, Germacrene D 0.05, cis-α-Bisabolene 0.07, γ-Elemene 0.05, β-Bisabolene 0.71, 6-Cadinene 0.05, Tetradecanal 0.10, Neoisolongifolane, hydroxy-0.07, β-Bisabolol 0.12 and n-Hexadecanoic acid 0.127. The volatile fraction of every sample of Citrus medica oil was characterized by a high content of α-pinene, γ-terpinene, and monoterpene aldehydes and a lower content of α- and β-pinene and myrcene, sesquiterpenes, and aliphatic aldehydes. GC analysis of the extracts allowed the determination of the enantiomeric distribution of five terpenoid compounds; a prevalence of four dextrorotatory isomers was observed. Oxycepedanin was the main component of the oxygenated heterocyclic fraction in the extracts of green fruits, while citropenin was the major oxygenated compound obtained from yellow citron(75).

Eleven constituents were identified from Citrus limonum leaves essential oils. Citronellal (29.31 %), limonene (17.59 %), (E)-citral (12.71 %), 1,6-octadien-3-ol,3,7-dimethyl (10.91 %), bicyclo [3.1.0] hexane, 4-methylene-1-(1-methyl) (8.80 %), 6-octen-1-ol,3,7-dimethyl (7.95 %), 2,6-octadien-1-ol,3,7-dimethyl- acacetate, (Z) (6.29 %), 1,3-cyclohexadiene,5-(1,5-dimethyl-4-hexenyl)-2-methyl, [S,R,S] (2.81 %), cyclohexene,3-(1,5-dimethyl-4-hexenyl)-6-methylene-, [S-(R,S)](1.64 %), bezene, 1-(1,5-dimethyl-4-hexenyl)-4-methyl (1.10 %) and cyclohexene,1-methyl-4-(5-methyl-1-methyl-1-hexene-4-hexenyl)-,(s) (0.88 %)(75,77).

Hydro distillation of the peels of Citrus limetta yielded 0.313% oil. Gas chromatographic analysis identified 17 constituents among which limonene (95.98 %) was found as major component followed by camphene (1.79 %), while the remaining terpenes were less than 1%. However, the chemical composition of essential oil of Citrus limetta and their percentage were: α-berguene 0.0688, α-pinene 0.0381, β-pinene 0.0299, ρ-cymene 0.3861, Camphene 1.7865, Limonene 95.9768, α -terpinene, 0.3337, Nerol 0.2907, Geraniol 0.3641, Geranial 0.0315, Citronellal 0.0951, α - terpinol, 0.3191, α -humulene, 0.0511, β-bisabolone 0.1276 and β-sinensol 0.0268(78,80).

Citrus sinensis fruit contains 1.5% essential oil. The components of fruit peel of Citrus sinensis and their percentage were: Octane 8.37, 4-Methylthiazole 0.14, n-Nonane 0.2, α-Pinene 6.65, Sabine 6.50, Myrcene 17.55, n-Octanal 0.19, α-Phellandrene 0.33, iso-Sylvesteren 1.14, Limonene 61.34, E-β-Ocimene 0.5, γ-Terpine 0.5, Linalool 1.84, α-Thujiene 2.31, trans-Limonene oxide 0.18, Citronellal 0.29, Decanal 1.40, β-Elemene 0.08, Tetradecane 0.2, β-Caryophyllene 0.1, Valencene 0.48, Pentadecane 0.2 and Hexadecane 0.2(80,81).

Nutritional analysis of Citrus aurantifolia, Citrus limonum, Citrus sinensis and Citrus medica (per 100g of edible portion) showed that they contained: moisture: 84.6, 85.0, 88.4, 87.1 g, protein: 1.5, 1.0, 0.8, 0.081 g, fat: 1, 0.9, 0.3, 0.04 g, fiber: 1.3, 1.7, 0.5, 1.1 g, carbohydrates: 10.9, 11.1, 9.3, 6.9 g, minerals:0.7, 0.3, 0.7, 0.3 g, Iron: 0.3, 2.3, 0.7, 0.55 mg, Carotene 15.0, 0, 0.009 μg, and Energy, 59.57, 43 and 30 Kcal respectively(58,59,82).

Phytochemical analysis showed that Citrus aurantifolia, Citrus limonum and Citrus sinensis fruits contained: alkaloids: 0.33 ±0.11, 0.54 ±0.20, 0.62 ±0.10; flavonoids: 0.29 ±0.20, 0.57 ±0.10, 0.19 ±0.20; tannins: 0.04 ±0.11, 0.01 ±0.10, 0.04 ±0.11; phenols: 0.02 ±0.10, 0.05±0.11, 0.01 ±0.10; and saponins: 0.22 ±0.30, 0.42 ±0.10, 0.08 ±0.10 mg/ 100g dry weight respectively(69,83).

Citrus flavonoids, coumarins, psoralens and carotenoids composition were:

Citrus sinensis flavonoids: Flavanones (Didymin 1.89%, Eriocitrin 0.31%, Hesperidin 28.6%, Narirutin 5.2%); Flavones (Neoeucitroside 0.59%, Poncirin 1.04%, 6,8-di-C-Glu-Apigenin 5.72%, 6,8-di-C-Glu-Diosmetin 0.35%, Rhoifolin 0.05%, Isorhiofolin 0.07%, Diosmin 0.09%, Neodiosmin 0.08%); Polyisoflavonides (Heptamethoxyflavone 0.08%, Nobiletin 0.33%, Sinensetin 0.37%, Tangeretin 0.04% and Aglycones (Taxifolin 0.03%, Acacetin 0.03%)). Coumarins and psoralen: (aurapenol, escorpen, xantheliten). carotenoids: (Phytone, phytofluene, β -carotene, β -carotene, cryptoxanthin, lutein, antheraxanthin, mutatoxanthins, violaxanthin, luteoaxanthins, auroxanthins).

Citrus limon flavonoids: (Flavanones (Eriocitrin 16.7%, Hesperidin 20.5%); Flavones (6,8-di-C-Glu-Apigenin1.17%, 6,8-di-C-Glu-Diosmetin 4.95%, 7,0-Rut-Luteolin 3.93%, Diosmin 3.12%), Aglycones (Luteolin 0.08%)); Coumarins and psoralen: (Bergapten, bergamottin, byakangelcin, citropen, imperatorin, isoimperatorin, isopimpinen, phellopterin, prangol, escoporen, scopolitin, umbelliferone, umbelliprenin, xantheliten). Carotenoids: (Phytogen, β-carotene, cryptoxanthin, violaxanthin, auroxanthin).

80
Citrus medica flavonoids: (hesperidin, eriocitrin, rutin and diosmin and naringin). Coumarins and psorals: (citrumedin-B, bergapten and citrophen). Citrus medica also contained 5-methoxy furfural, 5-hydroxy-2-hydroxymethyl-4H-pyran-4-one, diosmetin, diosmin, obacunone, aviprin, 3-(3-methoxy-4-hydroxyphenyl)-acrylic acid, vanillic acid and 3,4-dihydroxy-benzoic acid.

Citrus limetta flavonoids: (hesperidin, naringin). However, peels of Citrus limetta contained eighty-five compounds, including three abscisic acid derivatives, five limonoid glycosides, twenty-six dihydro-cinnamnic and cinnamic acid glycosides, eleven flavanone glycosides, seven flavone glycosides, seventeen flavonol glycosides, including limocitrol and limocitrin derivatives.

Citrus aurantifolia flavonoids: (Flavanones (Eriocitrin 0.29%, Hesperidin 1.77%, Neoeriocitrin 0.01%); Flavones (Diosmin 0.08%, Polymethoxyflavones (Heptamethoxyflavone 0.12%, Natsudaiaidain 0.04%, Nobiletin 0.52%, Tangeretin 0.18%); Aglycones (Taxifolin 0.04%, Luteolin 0.61%). Flavonoid composition of Citrus limon juice (mg/100 ml): Flavanones (Eriocitrin 0.29, Hesperidin 1.77, Neoeriocitrin 0.01); Flavones (Diosmin 0.08); Polymethoxyflavones (Heptamethoxyflavone 0.12, Natsudaiaidain 0.04, Nobiletin 0.52,Tangeretin 0.18); Aglycones (Taxifolin 0.04, Luteolin 0.61). Flavonoid composition of Citrus limon juice (mg/100 ml): Flavanones (Eriocitrin 16.7, Hesperidin 20.5); Flavones (6,8-di-C-Glu-Apigenin 1.17, 6,8-di-C-Glu-Diosmetin 4.95, 7-O-Rut-Luteolin 3.93, Diosmin 3.12); Aglycones (Luteolin 0.08). Flavonoid composition of Citrus sinensis juice (mg/100 ml): Flavanones (Didymin 1.89, Eriocitrin 0.31, Hesperidin 28.6, Narirutin 5.2); Flavones (Nacitrin 0.61, Rhoifolin 1.04, 6,8-di-C-Glu-Apigenin 5.72, 6,8-di-C-Glu-Diosmetin 0.35, Rhoifolin 0.05, Isorhoifolin 0.07, Diosmin 0.09, Niodiosmin 0.08); Polymethoxyflavones (Heptamethoxyflavone 0.08, Nobiletin 0.33, Sinensetin 0.37, angeretin 0.04); Aglycones (Taxifolin 0.03, Acacetin 0.03).

Flavonoid content of Citrus aurantifolia roots, stem, stem bark, leaves and peels were 0.64±0.40, 0.33±0.01, 0.42±0.01, 0.06±0.07 and 0.51±0.02 % respectively. While, the flavonoid content of Citrus limon roots, stem, stem bark, leaves and peels were 0.60±0.01, 0.34±0.02, 0.47±0.01, 0.65±0.03 and 0.48±0.01% respectively. Citrus sinensis roots, stem, stem bark, leaves and peels showed 0.63±0.01, 0.29±0.01, 0.38±0.05, 0.63±0.03 and 0.35±0.01% flavonoids content respectively.

Although pectin occurs in a majority of plant cell walls, it was most abundant in citrus (lime, lemon, grapefruit, and orange) fruits. The structure of pectin was primarily composed of repeating units of galacturonic acid joined by a 1→4 glycosidic linkages, which create a linear polymer. The regular linear structure was interrupted by the presence of neutral sugar side chains. Furthermore, the carboxyl groups of galacturonic acid may either remain as free acids, be esterified with methanol, or be neutralized with cations. The chemical structure of pectin varies by fruit species and also during the different developmental stages of the fruit.

Mineral contents of Citrus aurantifolia, Citrus limonum and Citrus sinensis were: phosphorus 0.29, 0.38, 0.41; potassium 1.0, 0.37, 0.82; magnesium 0.36, 0.33, 0.33; sodium 0.36, 0.33, 0.33 and calcium 2.81, 2.0 and 0.2 g/100g respectively.

Vitamin contents of Citrus aurantifolia, Citrus limonum, Citrus sinensis and C. medica fruits were: ascorbic acid: 22.88, 61.60, 19.36, 368; thiamin: 0.11, 0.88, 0.06, 0.052; riboflavin: 0.04, 0.02,0.11, 0.029 and niacin: 0.03, 0.14, 0.38 and 0.125 mg/100g respectively.

In citrus species, limonoids, limonoids were produced in leaves and transported to fruit and seeds, with limonoid concentration highest in the earliest stages of growth of leaves and fruit and highest in seeds during fruit growth and maturation. In leaves and fruit, total limonoid content increases during growth and maturation and decreases after maturation. In contrast, limonoid concentration does not decrease in seeds after fruit maturity, indicating that seeds act as storage tissues for these compounds.

Although pectin occurs in a majority of plant cell walls, it was most abundant in citrus (lime, lemon, grapefruit, and orange) fruits. The pectin was composed of repeating units of galacturonic acid joined by a 1→4 glycosidic linkages, which create a linear polymer. The regular linear structure is interrupted by the presence of neutral sugar side chains. Furthermore, the carboxyl groups of galacturonic acid may either remain as free acids, be esterified with methanol, or be neutralized with cations. The chemical structure of pectin varies by fruit species and also during the different developmental stages of the fruit.

Organic acid contents of Citrus aurantifolia, Citrus limonum and Citrus sinensis juices were: oxalic acid: 0.109, 0.094, 0.110; tartaric acid 0.336, 0.073, 0.012; malic acid 1.516, 1.465, 5.183; lactic acid: 1.857, 1.545, 0.915; citric acid 13.918, 73.936, 61.497 and ascorbic acid 0.636, 0.718 and 0.354 g/l respectively.

Pharmacological effects:

Citrus fruits, are one of the main fruit tree crops grown throughout the world. Although sweet orange (Citrus sinensis) is the major fruit in this group accounting for about 70% of citrus output. The group also encompasses other citrus fruits such as Citrus reticulata, Citrus vitis, Citrus aurantifolia, Citrus medica and Citrus limonum.
Antimicrobial effect:

The antibacterial potential of the leaf essential oil and petroleum ether, chloroform, ethyl acetate and methanol extracts of the leaves of *Citrus aurantifolia* were studied against human pathogenic bacteria (*Bacillus cereus, Enterobacter faecalis, Salmonella paratyphi, Staphylococcus aureus, Escherichia coli, Proteus vulgaris, Klebsiella pneumoniae, Pseudomonas aeruginosa and Serratia marcescens*) by agar well diffusion method. Leaf essential oil as well as ethyl acetate, chloroform and methanol extracts of *Citrus aurantifolia* leaves exhibited pronounced activity against Gram-positive and Gram-negative bacteria and their activity was quite comparable with the standard antibiotics such as tobramycin, gentamicin sulphate, ofloxacin and ciprofloxacin screened under similar conditions\(^{(94)}\).

Studying of the antibacterial effect of varieties of citrus available in Malaysian (*Citrus aurantifolia, Citrus reticulata, Citrus microcarpa, Citrus limon and Citrus sinensis*) against *Streptococcus pyogenes, Staphylococcus aureus, Escherichia coli* and *Pseudomonas aeruginosa* showed that the methanol extract of the five varieties of citrus exerted no inhibition at 5 and 10 mg/ml. The methanol extract of *Citrus microcarpa, Citrus reticulata* and *Citrus sinensis* at 20 mg/ml showed better inhibition compare to *Citrus aurantifolia* and *Citrus limon* against *Staphylococcus aureus* and *Escherichia coli*\(^{(95)}\).

*Citrus sinensis, Citrus limon, and Citrus aurantifolia* fruit peel extracts were investigated against gastrointestinal pathogens. *Citrus aurantifolia* and *Citrus limon* showed high zone of inhibition against *Shigella Spp., and E. coli* strains. Whereas *Citrus aurantifolia* was effective against *Salmonella Spp*\(^{(96)}\).

The antimicrobial potency of *Citrus aurantifolia* was studied against many bacterial and fungal pathogens, in the different forms [juice of the fruit, burnt rind of the fruit commonly known as (epa-ijebu) in the Yoruba dialect, and the oil obtained from steam distillation of the fruit]. Antimicrobial activity was carried out by the agar well diffusion. The clinical isolates used included Anaerobic facultative bacteria, namely: *Staphylococcus aureus ATCC 25213, Staphylococcus aureus, Salmonella paratyphi, Shigella flexneri, Streptococcus faecalis, Citrobacter spp, Serratia spp, Klebsiella pneumoniae, Pseudomonas aeruginosa, Escherichia coli ATCC 25922, and Escherichia coli; Fungi such as *Aspergillus niger* and *Candida albicans*; and Anaerobes which includes *Bacteroides* spp, *Porphyromonas* spp, and *Clostridium* spp. Crude extracts of all solvents used varied in zones of inhibition. The anaerobes and the Gram-positive bacteria were susceptible to all the extracts with minimum inhibitory concentration (MIC) ranging from 32mg/ml-128g/ml. The antifungal study showed that only the oil extract was potent against *A. niger*, while *Candida albicans* was susceptible to all the extracts with MIC ranging from 256mg/ml-512mg/ml. The Gram-negatives showed MIC ranging from 64mg/ml-512mg/ml. Minimum batericidal concentration (MBC) ranged between 32mg/ml to 512mg/ml depending on isolates and extracting solvent. The oil and palm-wine extract showed greater activity than the other extracts\(^{(97)}\).

The antimicrobial efficacy of leaf extract of *Citrus aurantifolia* Linn (CA) was evaluated against some microorganisms - bacteria and fungus (*Staphylococcus aureus, Escherichia coli, Klebsiella pneumonia, Pseudomonas spp, Aspergillus niger, Aspergillus fumigates, Mucor Spp and Pencillium Spp*). 100 µl of 10 mg CA were assessed against eight test microorganisms by agar well diffusion method. A different solvent was used to obtain CA leaf extract using maceration technique. Due to its high yield value, hydroalcoholic extract of CA was used for estimating the antimicrobial activity. The study demonstrates that the hydroalcoholic extract of CA leaf exhibit antibacterial activity on *Klebsiella pneumonia, Pseudomonas sp, Staphylococcus aureus* and antifungal activity among *Aspergillus niger, Aspergillus fumigates and Mucor species*\(^{(98)}\). Citric acid extracted from *Citrus aurantifolia* was tested as antimicrobial agent. The largest inhibition area of citric acid was obtained against *Escherichia coli*, 3.92 cm, and the smallest inhibition area is obtained against *Lactobacillus acidophilus, 2.16 cm\(^{(99)}\).

*Citrus aurantifolia* oils were tested against *Mycobacterium tuberculosis*. The saturated fatty acid palmitic acid exhibited higher activity against multidrug-resistant *M. tuberculosis* strains (MICs = 50 µg/ml) than the unsaturated fatty acids oleic acid and linoleic acid, which showed less activity (MICs = 100 µg/ml)\(^{(100)}\). The antibacterial activity of Lemon, lime and sudachi juices was studied against seven strains of *Vibrio* species. All juices were effective in inhibiting the growth of the *Vibrio* strains. Citric acid, the major organic acid in these juices, were found to be responsible for inhibiting the growth of *Vibrio parahaemolyticus*, whereas the sauce adjusted to higher pH values had no bacterial activity. Diluted sudachi juice or citric acid solution also had antibacterial activity independently. The results suggest that citrus fruit juices were effective in preventing infection with *Vibrio* species\(^{(101)}\).

The effect of essential oils, natural and concentrated lemon juice and fresh and dehydrated lemon peel was studied against *V. cholerae* 01 biotype Eltor serotype Inaba tox+. Products were used at different dilutions, when *V. cholerae* present at concentrations of 10\(^7\), 10\(^8\), 10\(^9\) and 10\(^10\) colony forming units (CFU) /ml, and after different exposure times. Concentrated lemon juice and essential oils inhibited *V. cholerae* completely at all studied dilutions and exposure times. Fresh lemon peel and dehydrated lemon peel partially inhibited growth of *V. cholerae*. Freshly squeezed lemon juice, diluted to 10\(^2\), showed complete inhibition of *V. cholerae* at a concentration of 10\(^3\) CFU/ ml after 5 min of exposure time; a dilution of 2 x 10\(^3\) produced inhibition after 15 min and a dilution of 10\(^4\) after 30 min\(^{(102)}\).
The antibacterial activity of crude extracts (aqueous and ethanolic) of *Citrus limonum* fruits against four wound isolates *Staphylococcus* sp, *Pseudomonas* sp, *Escherichia coli* and *Klebsiella* sp. showed that they exerted antibacterial activity with diameter of inhibition zone of 20, 18, 20 and 15 mm for ethanolic extract, and 15, 20, 11, and 10 mm for aqueous extract respectively. The potential inhibitory effect of *Citrus lemon* and *Citrus sinensis* on lipophilic, yeast like fungus *Malassezia furfur* which causes *Pityriasis versicolor*, chronic superficial fungal disease of the skin have been studied using two different methods (Disc diffusion and microdilution methods). In screening of lemon and orange oil by disc diffusion method, the diameters of inhibition zone were found to be 50 and 20 mm which were greater than inhibition zone of reference antibiotics, gentamycin 16.5mm and streptomycin 17 mm. Minimum inhibitory concentrations (MIC) of lemon and orange oil against *M. furfur* were found to be 0.8 and 2.2 μl/ml.

The antimicrobial activity of *Citrus lemon* was studied in *vitro*. The citrus peel oils show strong antimicrobial activity. The antimicrobial activity has been checked in terms of MIC by using different solvents against microorganisms like *Pseudomonas aeruginosa* NCIM 2036 for which MIC was 1:20 by methanol extract, for *Salmonella typhimurium* NCIM 5021 the observed MIC was 1:20 by acetone extract. While, for *Micrococcus aureus* NCIM 5021 the observed MIC was 1:20 by ethanol extract. The water extracts of all the materials showed various inhibitory effects. The juice of *Citrus limon* has antimicrobial activities more than other types of extracts. *Escherichia coli*, *Staphylococcus epidermidis*, *Streptococcus agalactiae*, *Pseudomonas aeruginosa*, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Escherichia coli*, *Salmonella typhi*, *Proteus spp.*, *Moraxella catarrhalis*, *Acinetobacter spp.* and *Candida albicans*. The water extracts of all the materials showed various inhibitory effects. The juice of *Citrus limon* has antimicrobial activities more than other types of extracts. *Escherichia coli*, *Staphylococcus epidermidis*, *Streptococcus agalactiae* and *Candida albicans* showed the highest resistance to these extracts. Lemon species might have antimicrobial activity against different Gram-positive, Gram-negative and yeast pathogens and could be used for prevention of various diseases caused by these organisms.

The effects of *Citrus limonum* essential oils (EO) compared to 0.2% chlorhexidine (CHX) and 1% sodium hypochlorite (NaOCl) was studied in multispecies biofilms formed by *Candida albicans*, *Enterococcus faecalis* and *Escherichia coli*. The biofilms were grown in acrylic disks immersed in broth, inoculated with microbial suspension (106 cells/ml) and incubated at 37°C /48 h. After the biofilms were formed, they were exposed for 5 minutes to the solutions: *Citrus limonum* EO, 0.2% CHX, 1% NaOCl or sterile saline solution. The discs were placed in sterile 0.9% NaCl and sonicated to disperse the biofilms. Tenfold serial dilutions were performed and the aliquots were seeded onto selective agar and placed in sterile 0.9% NaCl and sonicated to disperse the biofilms. Tenfold serial dilutions were performed and the aliquots were seeded onto selective agar and incubated at 37°C /48 h. Next, the number of colony-forming units per milliliter was counted and analyzed statistically (Tukey test, p <0.05). *Citrus limonum* EO promoted a 100% reduction of *C. albicans* and *E. coli*, and 49.3% of *E. faecalis*. CHX was less effective against *C. albicans* and *E. coli*, yielding a reduction of 68.8% and 86.7%, respectively. However, the reduction of *E. faecalis* using CHX (81.7%) was greater than that obtained using *Citrus limonum* EO. *Citrus limonum* EO was effective in controlling multi-species biofilms; the microbial reductions achieved by EO were not only similar to those of NaOCl, but even higher than those achieved by CHX, in some cases.

The antibacterial activity of *Citrus limon* was studied against Acne vulgaris. *Citrus limon* juice was used at different concentrations of (20%, 40%, 60%, 80% and 100%) on Propionibacterium acne. The *Citrus limon* juice was found to be effective at all concentrations used.

Essential oil from the fresh leaf of *Citrus medica* L. var. sarcodactylis possessed strong antimicrobial activity against *Staphylococcus aureus* and *Bacillus subtilis* (MIC 2,500 ppm). However, the antimicrobial efficiency of essential oil from this plant was much lower (about 40%) than that of tetracycline solution at the same concentration.

The antibacterial effect of the peels of *Citrus medica* was evaluated on *Staphylococcus aureus* MTCC96, *Escherichia coli* MTCC739, *Proteus vulgaris* MTCC426, *Bacillus subtilis* MTCC441, *Klebsiella pneumonia* MTCC109 and *Pseudomonas aeruginosa* MTCC424. The solvent used for the extraction of plants was water ethanol. The *in vitro* antibacterial activity was performed by agar cup method. The most susceptible Gram-positive bacteria were *Staphylococcus aureus* while the most susceptible Gram-negative bacteria was *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*. The antibacterial activity of active extract was compared with the standard antibiotic, streptomycin (100 ppm).

Antimicrobial activity of fruit juice and ethanolic extracts of root, leaf, bark, peel and pulp of *Citrus medica* were examined against seven bacteria (*Bacillus subtilis*, *Staphylococcus aureus*, *Enterococcus faecalis*, *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa* and *Proteus vulgaris*), two fungi (*Aspergillus flavus* and *A. niger*) and a yeast *Candida albicans* of clinical origin. The antimicrobial effects were studied using an *in vitro* disc diffusion method; minimum inhibitory concentrations (MIC) and minimum bactericidal concentrations (MBC) were determined by standard agar dilution method. All extracts and fruit juice showed varied level of antibacterial activity against one or more test bacteria. Root, leaf and bark extracts.
inhibited *S. aureus*, *E. faecalis* and *P. vulgaris* with maximum inhibition by root extract comparable to standard antibiotic. Fruit peels have shown least activity among all extracts and slightly inhibited growth of *S. aureus*, *K. pneumoniae* and *P. vulgaris*. The yeast *C. albicans* was not inhibited by any extract. Among bacteria *S. aureus* and *P. vulgaris* were highly susceptible to all extracts while *B. subtilis* was highly resistant and inhibited by only fruit juice. Root extract had the lowest MIC 0.5mg/ml and MBC 1mg/ml against *S. aureus*. The maximum MIC of extracts was 50 mg/ml and MBC 75 mg/ml. The minimum MIC of juice was < 1% and MBC 1% against *P. vulgaris* while maximum MIC was 3.5% and MBC 7%. Antifungal activity was shown by only root extract and fruit juice while *C. albicans* was resistant to all tested samples\(^{11(5)}\).

The antimicrobial activity against the selected bacteria and fungi was observed for the alcoholic extract of *Citrus medica*, it was found active against all the tested bacteria and fungi (*Enterobacter aerogenes*, *Staphylococcus aureus*, *Bacillus subtilis*, *Proteus vulgaris*, *Klebsiella pneumoniae*, *Shigella flexneri*, *Chryseobacterium gleum* and fungi *Candida albicans*, *Aspergillus niger* and *Aspergillus flavus*). The maximum antibacterial activity was shown against *Staphylococcus aureus* (6.3 mm) by methanolic extract, whereas the maximum antifungal activity was shown against *A. niger* (6.3 mm) and minimum activity was shown against *A. flavus* (3 mm)\(^{11(5)}\).

The antibacterial investigation of crude extracts (aqueous and ethanolic) of fruits of *Citrus medica* var *limetta* against four wound isolates *Staphylococcus* sp, *Pseudomonas* sp, *Escherichia coli* and *Klebsiella* sp., showed that they exert antibacterial activity with diameter of inhibition zone of 10, 12, 10 and 10 mm for ethanolic extract, and 8, 9, 8 and 9 mm for aqueous extract respectively\(^ {11(3)}\).

The aqueous extract of the peels of *C. limetta* produced a good antimicrobial activity against 15 isolates, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Streptococcus pyogenes*, *Enterococcus faecalis*, *Streptococcus pneumoniae*, *Streptococcus agalactiae*, *Pseudomonas aeruginosa*, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Escherichia coli*, *Salmonella typhi*, *Proteus* spp., *Moraxella catarrhalis*, *Acinetobacter* spp. and *Candida albicans*, with inhibition zones ranged (from 10 to 35mm) against Gram-positive or Gram-negative bacteria with no activity against *Candida*\(^ {10(6)}\).

The results of antimicrobial activity of peel essential oil of *Citrus limetta* var. Mitha tested by disc diffusion method, against different against bacteria and fungi showed that it exhibited maximum zone of inhibition against *Bacillus cereus* ATCC 14579 (28 mm) and *Bacillus subtilis* ATCC 6633 (26 mm) followed by *Staphylococcus aureus* ATCC 25923 (21 mm), whereas the minimum zone of inhibition was shown by *Fusarium oxysporum* ATCC 48122 (11 mm) after 48 h of incubation at their respective temperature (37°C for bacteria and 25°C for fungi). The inhibition zones, measured after 48 and 96 h, showed that it was active against all the tested bacteria and fungi\(^ {7(9)}\).

The anti typhoid activity of aqueous extract of fruit peel *Citrus sinensis* was studied in vitro. The aqueous extracts of fruit peel *Citrus sinensis* exhibited antityphoid activity against *Salmonella typhi*, *Salmonella paratyphi A* and *Salmonella paratyphi B*\(^ {11(3)}\).

The antibacterial activity of aqueous and ethanolic extracts of *Citrus sinensis* leaves was evaluated against *Escherichia coli*, *Pseudomonas aeruginosa*, *Klebsiella pneumoniae*, and *Staphylococcus aureus*. The in vitro antibacterial activity was performed by agar disc diffusion method. The aqueous extract showed a zone of inhibition against *Escherichia coli* (7mm), while on the other organisms it showed little or no zones of inhibition ranging from 0-3mm in diameter. The ethanolic extract also showed little zones of inhibition against the tested organisms ranging from 1-3mm in diameter\(^ {11(4)}\).

The peels were air-dried and ground to powder, extracted with 95% ethanol. The extract was subjected to antibacterial study against six *Salmonella paratyphi* B, one *Salmonella typhi* and three *Aeromonas hydrophila*. Agar diffusion method was employed to test the antibacterial activity of the extract and the MIC and MBC of the extract were determined by broth dilution technique. The results showed that the isolates were sensitive to the extract, with MIC of 0.25-2.5mg/ml and MBC of 0.5-5.0mg/ml\(^ {11(5)}\).

Peels of *Citrus lemon*, *Citrus sinensis* and *Citrus limetta* were dried and extracted by cold water, hot water, methanol, ethanol, ethyl acetate and acetone. Extracts were subjected to antibacterial and antifungal susceptibility assay against (Pseudomonas aeruginosa, *Salmonella typhimurium*, *Micrococcus aureus*, *Trichophyton mentagrophytes*, *Microsporum canis* and *Candida albicans*) by agar well diffusion method. All the extracts of *Citrus lemon* were found to be effective against the tested bacterial pathogens except hexane extracts. Methanol and acetone extract showed maximum zone of inhibition of 18 mm. Only methanol extract was effective against fungal pathogens showing a zone of inhibition of 18 mm. Hexane extract of *Citrus sinensis* was found to be most effective against bacterial pathogens giving a zone of 13 mm. Only the cold water extract of orange was effective against fungal pathogens. Acetone extract of *Citrus limetta* was most effective giving a zone of 20 mm against bacterial pathogens. Only cold water and ethyl acetate extracts of *Citrus limetta* were effective against fungal pathogens giving a zone of inhibition of 17mm and 15 mm respectively\(^ {11(6)}\).

The antimicrobial activity of methanolic extract of *C. sinensis* fruit peel was tested against three bacterial and two fungal strains using turbidimetric or tube dilution method and paper disc diffusion method. *C. sinensis* fruit peel methanolic extract exhibited antibacterial activity against *Escherichia coli* with minimum inhibitory
concentration of 0.78 μg/ml and minimum bactericidal concentration of 6.25 μg/ml, and appreciable antifungal activity with minimum inhibitory concentration of 12.5 μg/ml. The dried peels of *Citrus sinensis* were defatted and then were subjected to the methanolic extraction. The methanolic extract obtained was dissolved in various solvents such as water, methanol, ethanol, chloroform, diethyl ether and were subjected to evaluation of antitubercular activity against *Mycobacterium tuberculosis* by Microplate Alamar Blue Assay (MABA) method. The results concluded that the extract dissolved in water as solvent showed significant activity at 50μg/ml. The antimicrobial activity of petroleum ether extract of the peels of *Citrus sinensis* was studied against various Gram positive organisms (*Staphylococcus epidermidis*, *Micrococcus luteus*, *Bacillus subtilis*), Gram negative organisms (*Escherichia coli*, *Pseudomonas vulgaris*, *Salmonella typhi*), and fungal strains (*Aspergillus niger*, *Candida albicans*). Antimicrobial activity was conducted by the agar well diffusion method. The extract showed various levels of antimicrobial activity on the tested microorganisms. It was more effective against *Staphylococcus epidermidis*, *Micrococcus luteus* and *Pseudomonas vulgaris* followed by *Salmonella typhi*, *Escherichia coli* and *Candida albicans*, while it showed no activity against *Bacillus subtilis* and *Aspergillus niger*.

The antimicrobial effects of aqueous extracts of peel, juice and leaves from fresh *Citrus sinensis* was evaluated against 3 Gram-positive and 6 Gram-negative bacterial, including *S. aureus*, *S. pyogenes*, *E. feacalis*, *P. aeruginosa*, *K. pneumoniae*, *E. coli*, *S. typhi*, *Proteus spp.*, *M. catarrhalis*. Citrus juices showed the highest antibacterial activity against most of the studied bacterial isolates. Moderate activity produced by the citrus peels and the lowest effect was produced by the extract of the citrus leaves.

The antimicrobial activity of *Citrus sinensis* oil was studied by paper disc diffusion method against *Bacillus subtilis* and *Escherichia coli*. Zones of inhibition of *E. coli* and *B. subtilis* were 13 and 17mm respectively.

The antimicrobial potential and the minimum inhibitory concentration (MIC) of aqueous and ethanol (cold and hot) extracts of *Citrus sinensis* peel extracts was investigated against *Aggregatibacter actinomycetemcomitans*, *Porphyromonas gingivalis* and *Prevotella intermedia*, using agar well diffusion method. The results showed that *Prevotella intermedia* and *Porphyromonas gingivalis* were resistant to aqueous extracts while *Aggregatibacter actinomycetemcomitans* was inhibited at very high concentrations. Hot ethanolic extracts showed significantly higher zone of inhibition than cold ethanolic extract. Minimum inhibitory concentration of hot and cold ethanolic extracts of *Citrus sinensis* peel ranged between 12-15 mg/ml against all three periodontal pathogens.

*Citrus aurantifolia* juice destroyed human immunodeficiency virus (HIV). Ten percent of *Citrus aurantifolia* juice produced a 1000-fold reduction in HIV activity in a laboratory sample.

To evaluate the effect of extracts of peels of *Citrus sinensis* (Cs) on the replication of coronavirus (CoV) and on the expression of TRP genes during coronavirus infection, HeLa-CEACAM1a (HeLa-epithelial carcinomaembryonic antigen-related cell adhesion molecule 1a) cells were inoculated with MHV-A59 (mouse hepatitis virus-A59) at molarity of 30. 1/50 dilution of the extracts was found to be the safe active dose. ELISA kits were used to detect the human IL-8 levels. Total RNA was isolated from the infected cells and cDNA was synthesized. Fluidigm Dynamic Array nanofluidic chip 96.96 was used to analyze the mRNA expression of 21 TRP genes and two control genes. Data was analyzed using the BioMark digital array software. Determinations of relative gene expression values were carried out by using the 2(-ΔΔCt) method (normalized threshold cycle (Ct) value of sample minus normalized Ct value of control). TCID50/ml (tissue culture infectious dose that will produce cytopathic effect in 50% of the inoculated tissue culture cells) was found for treatments to determine the viral loads. TRPA1, TRPC4, TRPM6, TRPM7, TRPM8 and TRPV4 were the genes which expression levels changed significantly after Cs extract treatments. The virus load decreased when Cs extracts was added to the CoV infected cells. Extract treatment had an effect on IL-8 secretion, TRP gene expression and virus load after CoV infection.

**Anthelmintic and repellent effects:**

Methanolic extract of *Citrus medica* was evaluated for anthelmintic activity against Indian adult earthworm *Pheretima posthuma*. Various concentrations of extract were tested and results were expressed in terms of time for paralysis and time for death of worms. Piperazine citrate (10 mg/ml) was used as a reference standard and distilled water as a control group. Dose dependent anthelmintic activity was possessed by the methanolic extract of *Citrus medica*.

Petroleum ether extracts of *Citrus medica* leaves also possessed dose dependant anthelmintic activity against the Indian adult earthworms (*Pheretima posthomad*). The effect which could be attributed to inhibition of glucose uptake in the parasites and depletion of its glycogen synthesis. It also activated nicotinic cholinergic receptor in the worms resulting in either persistent depolarization or hyperpolarization. The anthelmintic activity of petroleum ether extract of the peels of *Citrus sinensis* was studied against Indian adult earthworms, *Pheretima posthuma*, it exhibited a dose dependent inhibition of spontaneous motility (paralysis), and evoked responses to pin-prick, and the effects were comparable with that of piperazine.
The effect of aqueous extract of this *Citrus medica* on viability of the protoscolices of *Echinococcus granulosis* in *vitro*, in a concentration of 90 mg/ml, the aqueous extract was effective in killing all protoscolices after four days of incubation. \(^{(127)}\)

Alcoholic extracts of the rind of *Citrus medica* showed *in vitro* anthelmintic activity against human *Ascaris lumbricoides* \(^{(128)}\). The larvicidal potential of hexane and petroleum ether extracts of *Citrus limetta* peels was assessed against dengue fever vector, *Aedes aegypti*, and malarial vector, *Anopheles stephensi*, by evaluating the toxicity effects on early fourth instars. Both the extracts were found effective against both the species. The bioassay with hexane extracts resulted in LC\(_{50}\) values of 132.45 and 96.15 ppm against *A. stephensi* and *A. aegypti*, respectively; while the petroleum ether extract from the *C. limetta* peels showed LC\(_{50}\) values of 244.59 and 145.50 ppm, respectively. It revealed that the hexane extracts possessed 1.9-fold more larvicidal potential against *A. stephensi* and 1.5-fold more efficacy against *A. aegypti* as compared to the extracts obtained using petroleum ether as solvent. The data further revealed that the extracts were 1.4-1.7 times more effective against *A. aegypti* as compared to *A. stephensi* \(^{(129)}\).

The mosquito repellent activity of extracts from Peels of five citrus fruit species, *Citrus sinensis*, *Citrus limonum*, *Citrus aurantifolia*, *Citrus reticulata* and *Citrus vitis*, were studied using five different concentrations, 5%, 10%, 15%, 20% and 25% (volume by volume). Topical application of the extract concentrations on human volunteers revealed that 20% and 25% repelled mosquitoes 2 hours and 5 hours, respectively. Short-lived and mild skin itching and sneezing reactions were observed as side effects \(^{(130)}\).

**Antioxidant effect:**

The DPPH radical scavenging activities of the leaf extracts and leaf essential oil of *Citrus aurantifolia* were investigated in 1, 1-diphenyl-2-picrylhydrazyl (DPPH) radical. Among the leaf extracts and leaf essential oil of *C. aurantifolia* studied, leaf methanol and ethyl acetate extracts showed potent scavenging activity \(^{(94)}\). The antioxidant effects of fresh juice and peel extract of *Citrus aurantifolia* was evaluated. 5 μl of lime juice didn't change LDL oxidation. 10 μl of juice inhibited LDL oxidation, and with increasing the juice concentration, LDL was oxidized faster. Both juice and peel demonstrated antioxidant properties \(^{(131)}\).

The antioxidant properties of *Citrus aurantifolia* peel and leaves from different areas were studied using the diphenyl picryl hydrazyl, 2,2'-azino-bis(3-ethyl benzo thiazoline-6-sulfonic acid) and ferric reducing ability of plasma assays, and the β-carotene bleaching test. Methanol extracts of the peel and leaves demonstrated the strongest radical scavenging activity. A similar trend was observed with the reducing ability, with values from 112.1 to 146.0 μmol/l Fe/ g \(^{(87)}\).

The in *vitro* antioxidant activities of juices of both unripe and ripe *Citrus aurantifolia* was investigated. Juices were extracted from fresh ripe and unripe fruits by mechanical squeezing and were used for antioxidant study. The antioxidant activity of juice of *Citrus aurantifolia* was evaluated by using the free radical scavenging activity of 1, 1-diphenyl-2-picrylhydrazyl (DPPH), total antioxidant capacity (TAC) by the phosphomolybdenum method. Unripe juices showed more antioxidant scavenging activity as compared to ripe juices. The lower antioxidant activity of ripe fruit juices could be due to the possible reduction in the ascorbic acid and total phenolic content during ripening. The unripe juice showed a range of 3.45 to 28.23 % at 25 to 200 μl concentrations respectively. At the same concentration range the value for the ripe juice was found to be 2.08 to 23.56 % respectively. The total antioxidant content in terms of ascorbic acid (mg/ml) was 0.178 and 0.127 mg/ml for unripe and ripe juices respectively \(^{(132)}\).

Various *in vitro* and *ex vivo* studies were performed to estimate the polyphenols and flavonoids in the *Citrus limonum* pulp and peel. The reducing power, free radical scavenging activity and lipid peroxide inhibition were also investigated. The lemon peel was found to have a slightly greater contents of polyphenols and flavonoids. The peel extracts also showed better reducing power and higher free radical scavenging activity. The peel extracts gave 82.3% of inhibition towards lipid peroxidation, when compared to the pulp extracts which showed an inhibition of 78.2% \(^{(133)}\).

*Citrus limon* essential oil (EO) showed strong antioxidant activity in mice. Furthermore, it also possessed scavenger activity in all *in vitro* tests \(^{(134)}\). Essential oil of *Citrus limon* leaves reduced the lipid peroxidation and nitrite content as well as increase the glutathione reduced (GSH) levels and enzymatic antioxidant activities (super-oxide dismutase, catalase and glutathione peroxidase) in mice hippocampus. These findings strongly support the hypothesis that oxidative stress in hippocampus might occur during neurodegenerative diseases, proving that hippocampal damage induced by the oxidative process played a crucial role in brain disorders, which implies that a neuroprotective effect could be achieved using *Citrus limon* essential oil as antioxidant treatment \(^{(135)}\). The action of *Citrus limon* essential oil to control free radical-induced lipid peroxidation and preventing tissue damage in skin was investigated. The superoxide anion scavenging activity of essential oil was evaluated by the enzymatic hypoxanthine/xanthine oxidase system. The same oil diluted in DMSO or grape-seed oil was spread on the face of human volunteers after UV exposition. A sample of skin lipids was collected and the presence of peroxyl radicals was detected based on the measurement of light emitted (chemiluminescence) when the excited carbonyl and singlet oxygen decay to ground state. Data
demonstrated that the lemon essential oil was more active than \( \alpha \)-tocopherol against \( \text{O}^2 \) - and peroxide free radical inhibition at 1:100 dilution \(^{136}\). The antioxidant activity of 70% aqueous methanol extract of the defatted powdered leaves of *Citrus medica* was calculated to be 102.9\( \mu \)g/ml. It also exerted significant reduction in blood glucose level to (105.2±8.35) in diabetic rats after one month of treatment with a dose of 200 mg/kg and to (87.4±6.30) with 400mg. The authors concluded that the methanol extract of the defatted powdered leaves of *Citrus medica* exhibited significant antihyperglycemic activity which might be attributed to the presence of flavonoid compounds \(^{137}\). The extract of *Citrus medica* showed significant antioxidant activity verified by different assays (DPPH test, \( \beta \)-carotene bleaching test and bovine brain peroxidation assay) in a dose dependent manner as compared to ascorbic acid \(^{138-139}\).

The antioxidant potential of ethanolic extract of *Citrus medica* L. peels (ECMP) extract was studied on Thiobarbituric Acid Reactive Substances (TBARS) as index of lipid peroxidation and on the glycemic control in streptozotocin induced diabetic rats. ECMP was used in as (200 and 400 mg/kg). The elevated level of blood glucose, glycosylated hemoglobin, TBARS observed in diabetic rats were significantly decreased after treatment with ECMP for 8 weeks in diabetic rats. From the results, the ethanolic extract of *Citrus medica* L. peels possessed potent antioxidant and antidiabetic properties \(^{140}\).

The results of antioxidant activity of peel essential oil of *Citrus limetta* var. Mitha showed that it was able to reduce the stable radical 1- diphenyl-2-picrylhydrazyl (DPPH) to yellow-colored DPPH-H reaching 87.77% of DPPH scavenging effect at its 100% concentration comparative to ascorbic acid as reference standard being a strong antioxidant reagent \(^{79}\).

The *in vitro* antioxidant activity of the methanol extracts of *Citrus limetta* fruit peel (MECL) was evaluated in different models such as DPPH, superoxide radical and nitric oxide radical scavenging activity and inhibition of lipid peroxidation. The total phenolic compounds present in the extracts were estimated by Folin-Ciocalteu’s reagent. The extract showed good free radical scavenging activity in a dose dependent manner. The \( IC_{50} \) values for DPPH, superoxide radical, nitric oxide radical inhibition and lipid peroxidation assays of MECL were 7.36, 9.36, 136.45 and 111 respectively. Measurement of total phenolic compounds by Folin-Ciocalteu’s reagent indicated that 1 mg extract contains 126.85 \( \mu \)g equivalent of pyrocatechol in MECL \(^{141}\).

Extracts prepared from the *Citrus limetta* fruit peels were studied for antioxidant and anti-inflammatory activity using *in vitro* bioassays. Among all extracts, ethanol extract of *Citrus limetta* fruit peels has shown promising anti-oxidant and anti-inflammatory activity \(^{142}\).

It was reported that juice and edible parts of *Citrus sinensis* of different origin and from different varieties exerted antioxidant activity, while, the peel extracts were found to have a good total radical antioxidative potential \(^{143-144}\). Methanolic extracts of 6 citrus species (C. *sinensis* var. Washington Navel, C. *sinensis* var. Valencia, C. *reticulata* var. Page, C. *sinensis* var. Sungin, C. *paradise* and C. *aurantium*) peels and tissues growing in Pakistan were investigated for their antioxidant activity by DPPH method. \( IC_{50} \) for antioxidant activity ranged from 0.8- 4.7 mg/ml. Total phenolic content of the citrus spp. samples (based on folin Ciocalteu method) varied from 99.4 to 229.5 mg gallic acid equivalent/g of extract and flavonoids content (based on colorimetric AlCl\(_3\) method) varied from 0.2 to 25.7 mg quercetin equivalent/g of extract. There were no correlation between the total phenolic and/or flavonoids contents and antioxidant activity in tissues and/or peels \(^{145}\).

The *in vitro* antioxidant activity of *Citrus sinensis* peel extracts from different solvents were investigated. Among the different solvent extracts methonolic extract exhibited the highest *in vitro* scavenging activity followed by other solvent extracts which includes ethanolic, hexane, benzene, ethyl acetate, and chloroform with \( IC_{50} \) values 65.44, 120, 138.45, 151.34, 170.34, 185.35 with 55.6 % inhibitory concentration for ascorbic acid \(^{146}\).

Hesperidin was extracted from the peel of *Citrus sinensis*, and its antioxidant capacity was evaluated. Hesperidin was found to be moderately active as an antioxidant agent; its capacity reached 36% \(^{147}\).

The antioxidant, protective and bioavailability of *Citrus sinensis* juice (poly)phenols were studied by monitoring urinary flavanone metabolites and ring fission catabolites produced by the action of the colonic microflora. Twelve volunteers [6 men and 6 women; body mass index (in kg/m\(^2\)): 23.9-37.2] consumed a low (poly)phenol diet for 2 days before first drinking 250 ml pulp-enriched orange juice, which contained 584 \( \mu \)mol (poly)phenols of which 537 \( \mu \)mol were flavanones. Urine collected for a 24-h period was analyzed qualitatively and quantitatively. A total of 14 metabolites were identified and quantified in urine after orange juice intake. Hesperetin-O-glucuronides, naringenin-O-glucuronides, and hesperetin-3′-O-sulfate were the main metabolites. The overall urinary excretion of flavanone metabolites corresponded to 16% of the intake of 584 \( \mu \)mol (poly)phenols. This bioavailability could be explain the antioxidant and protective effect of orange juice (poly)phenols \(^{148}\).

**Cardiovascular effects:**

According to World Health Organization’s recent report, citrus fruits offer protection against cardiovascular diseases by reducing levels of homocysteine. Orange fruit contained vitamin C, carotenoids and
flavonoids, which were cardio-protective. Cholesterol lowering effect of orange was produced by limonene. Furthermore, polymethoxylated flavones (PMFs) were present in citrus fruit peel, which can lower cholesterol more effectively than some prescription drugs, without showing any side effect. Although, a variety of citrus fruits contain PMFs, the most common PMFs were tangeretin and nobiletin. PMFs work like statin drugs that inhibit the synthesis of cholesterol and triglycerides inside the liver. However, a tablespoon or so of the peel of orange each day, may be a practical way of achieving some cholesterol-lowering benefits.  

Hesperidin, a bioflavonoid, was an abundant and inexpensive by-product of citrus cultivation. A deficiency of this substance in the diet has been linked with abnormal capillary leakiness as well as pain in the extremities causing aches, weakness and night leg cramps. No signs of toxicity have been observed with the normal intake of hesperidin or related compounds.

The effect of drinking the juice of two different citrus fruits on vascular neointima formation was studied using a cuff-induced vascular injury mouse model. Male C57BL6 mice were divided into five groups as follows: 1) Control (water) (C), 2) 10% citrus unshiu (CU) juice (CU10), 3) 40% CU juice (CU40), 4) 10% citrus iyo (CI) juice (CI10), and 5) 40% CI juice (CI40). After drinking them for 2 weeks from 8 weeks of age, cuff injury was induced by polyethylene cuff placement around the femoral artery. Neointima formation was significantly attenuated in CU40, CI10 and CI40 compared with C. However, no remarkable preventive effect was observed in CU10. The increases in levels of various inflammatory markers including cytokines such as monocyte chemotactic protein-1, interleukin-6 (IL-6), IL-1β, and tumor necrosis factor-α in response to vascular injury did not differ significantly between C, CU10 and CI10. The increases in cell proliferation and superoxide anion production were markedly attenuated in CI10, but not in CU10 compared with C. The increase in phosphorylated ERK expression was markedly attenuated both in CU10 and CI10 without significant difference between CU10 and CI10. Accumulation of immune cells did not differ between CU10 and CI10. The results indicate that drinking citrus fruit juice attenuates vascular remodeling partly via a reduction of oxidative stress.

The cardiovascular effects of Citrus aurantifolia fruit were studied experimentally. The anti-hypertensive effect was tested on three experimental hypertensive models including cadmium induced hypertensive model, glucose induced hypertensive model, and normotensive model. The systolic pressure, diastolic pressure, mean blood pressure and heart rate of Sprague Dawley rats were measured by tail cuff method from the tail of rats using non-invasive blood pressure instrument and blood pressure weights were also measured. Three different doses were used for screening 0.25, 0.5, and 0.75% orally given and there effects on normotensive rats were observed at 2hr, 4hr and 6hr intervals. The dose of 0.75% was selected because it significantly reduced the mean blood pressure, systolic blood pressure, diastolic blood pressure, and heart rate. The methanol extract of Citrus aurantifolia, administered at the dose of 0.75mg orally, significantly (p<0.01) reduced systolic blood pressure, mean blood pressure, diastolic blood pressure, heart rate and body weight of Sprague Dawley rats in both normotensive and hypertensive experimental models when compared to control groups.

The effects of an aqueous extract of Citrus aurantifolia on arterial blood pressure and on isolated heart and aorta activities was evaluated experimentally. Rabbits were used for the study on the arterial blood pressure using a Ludwig manometer. Albino Wistar rats were used for the isolated heart and aorta activities using isolated organ bath systems. Aqueous extract of Citrus aurantifolia (4mg/kg-16mg/kg bw) produced a dose-dependent and significant decrease in rabbit blood pressure (p<0.05). This hypotension was not prevented by atropine (2 mg/kg bw, p>0.05). Aqueous extract (4mg/kg-16mg/kg bw) was dose-dependently reduced hypertension evoked by adrenalin (30 μg/kg bw). The extract also induced both negative inotropic and chronotropic effects on the heart contractile activity. The extract induced a dose dependent relaxation of contractions produced by adrenalin or by KCl. Aqueous extract of Citrus aurantifolia evoked vasorelaxant effects were totally abolished by removal of the endothelium layer or by a pretreatment with L-NAME.

In vitro / in vivo study was designed to determine the effect of Citrus limon on blood parameters, coagulation and anticoagulation factors. In vitro tests revealed highly significant increase in thrombin time and activated partial thromboplastin time by Citrus limon, whereas fibrinogen concentration was significantly reduced in comparison to control, however prothrombin time was not affected significantly. In vivo testing of Citrus limon was carried out at three different doses (0.2, 0.4 and 0.6ml/kg) in healthy rats. Significant changes were observed in hematological parameters such as erythrocytes, hemoglobin and mean corpuscular hemoglobin concentration. Bleeding time and thrombin time were significantly prolonged and there was increase in protein C and thrombin antithrombin complex levels. These results may be due to inactivation of thrombin because it significantly decreased fibrinogen concentration and inhibited platelet aggregation. Citrus limon showed maximal anticoagulant effect at 0.4ml/kg, which suggest that Citrus limon possessed an anti-thrombin component and could prevent thrombosis and playing a cardio-protective role.

The protective effect of the ethanolic extract of Otroj, Citrus medica (EEOT) against isoproterenol (ISO)-induced cardiotoxicity was evaluated in rats. Rats were administered EEOT (250 and 500 mg/kg) or
vehicle orally for 15 days along with ISO (85 mg/kg, sc) on the 14th and 15th day. ISO induced cardiac dysfunction, increased lipid peroxidation and alteration of myocyte-injury specific marker enzymes. ISO also showed an increase in levels of plasma cholesterol, triglycerides (TG), LDL-C, and VLDL-C. Moreover, the histological investigations showed myocardial necrosis and inflammation. EETO treatment brought the above parameters towards normal level. Moreover, in vitro DPPH radical scavenging and β-carotene-linoleic acid tests of the EEOT exhibited a notable antioxidant activity in both assays used. In addition, histopathological examination reconfirmed the protective effects of EEOT. Accordingly, C. medica alleviates myocardial damage in ISO-induced cardiac injury and demonstrates cardioprotective potential.

The antihypertensive effect of C. medica limetta leaves was investigated against the acute response of blood pressure to angiotensin II administration. The results showed that different concentrations of the aqueous extract prevented the raise of systolic blood pressure (p < 0.001 vs. vehicle), diastolic blood pressure (p < 0.0002 vs. vehicle) and mean blood pressure (p < 0.0000 vs. vehicle); with a dose dependent effect for diastolic pressures at 125–500 mg/kg dosages. The 500 and 1000 mg/kg doses inhibited the action of Ang II in similar extent to telmisartan. Toxic signs or deaths were not observed in mice treated with a dose of 2000 mg/kg.

Four-week consumption of orange juice in healthy middle-aged, normal-weight men reduced diastolic blood pressure (DBP)$. However, the effects of four-week intake of natural and commercial orange (Citrus sinensis) juice (CSJ) on blood pressure was evaluated in healthy volunteers. 22 healthy subjects were included and randomly divided into two groups. Group A consumed commercial CSJ during the first four-week period. After a two-week washout period, they consumed natural CSJ for another four weeks. The procedure was reversed in group B. The participants were asked to drink 500 ml/day of either natural or commercial CSJ twice a day with breakfast and dinner. After drinking commercial CSJ, diastolic and systolic blood pressure were significantly decreased (5.13%; P = 0.03 and -5.91%; P = 0.003, respectively). However, consumption of natural CSJ did not have significant effects on either diastolic or systolic blood pressure. Higher flavonoid, pectin, and essential oils content of concentrated products compared to natural juice might have been responsible for this effect.

An attempt was made to isolate hypotensive substances from a hot water extract of Citrus unshiu. Six flavonoid glycosides were isolated by repeated chromatography and gel filtration after extraction with butanol and treatment with lead subacetate. Each component was intravenously injected into SHR-SP rats (1 mg/100g body weight). 3,6-di-C-glucosylapigenin and rutin were found to lower their blood pressure.

Hypolipidemic effect:

The effect of Citrus aurantifolia peel essential oil was studied on serum triglyceride and cholesterol in Wistar rats. Thirty Wistar rats were divided into 5 groups: control, sham, and 3 experimental groups. The animals were treated in 2 phases: first, except for control group, which received normal saline, the rest of the groups were fed with a high cholesterol regimen to induce hyperlipidemia; then, the 3 experimental groups were treated with Citrus aurantifolia peel essential oil in 3 different doses: 25, 50, and 100 μl/kg. The sham group demonstrated a significant rise in mean serum triglyceride, cholesterol, and LDL level in comparison with the control group (p < 0.05). The results of experimental groups treated with peel essential oil in 50 and 100 μl/kg doses demonstrated a significant reduction in triglyceride, cholesterol, and LDL (p < 0.01).

The effect of Citrus aurantifolia on hepatic lipidomics was studied in female albino rats, it was found that the fresh juice of lime had different effects on cholesterol, triacylglycerol and phospholipid concentrations of the liver. The low concentration of lime juice (30μl) did not showed considerable effect on cholesterol concentration of the liver. Increase in cholesterol concentration was observed only after applying a concentration of 60 μl. Beyond this concentration, cholesterol concentration was decreased. Therefore, it was demonstrated that peak stimulation for lime juice is 60μl. Similar effect also occur for triacylglycerol concentration. However, it caused dose-dependent increase in phospholipids concentration.

Eriocitrin (eriodictyol 7-rutinoside), a powerful antioxidative flavonoid in lemon with lipid-lowering effects was evaluated in a rat model of high-fat diet to investigate its mechanism of action. A feeding experiments was conducted in zebrafish with diet-induced obesity. Oral administration of eriocitrin (32 mg/kg/day for 28 days) improved dyslipidaemia and decreased lipid droplets in the liver. DNA microarray analysis revealed that eriocitrin increased mRNA of mitochondrial biogenesis genes, such as mitochondrial transcription factor, nuclear respiratory factor 1, cytochrome c oxidase subunit 4, and ATP synthase. In HepG2 cells, eriocitrin also induced the corresponding orthologues, and reduced lipid accumulation under conditions of lipid loading. Eriocitrin increased mitochondrial size and mtDNA content, which resulted in ATP production in HepG2 cells and zebrafish.

Citrus medica cv Diamante peel extract lowered plasma cholesterol and triglycerides in mice.

Anticancer effect:

Epidemiological studies have shown that the consumption of fruits is associated with a decreased risk of cancer. The ingestion of citrus fruit has been reported to be beneficial for the reduction of certain types of human cancer. The in vitro effects of concentrated lime juice (CLJ) extract was evaluated on the
spontaneous proliferation of human breast carcinoma cell line (MDA-MB-453) and a human lymphoblastoid B cell line (RPMI-8866). CLJ extract was prepared by freeze-drying fresh fruit juice and dialyzing the concentrated extract against phosphate buffered saline in order to deplete low molecular weight micronutrients such as flavonoids as well as adjusting the pH of the extract to the physiological range. The effects of different concentrations of the CLJ extract on the spontaneous proliferative responses of the cell lines were determined by 3 H-thymidine incorporation after 24 hrs of incubation. CLJ extract had no significant effect on MDA-MB-453 cell line, however, using the concentrations of 125, 250, and 500 µg/ml of CLJ extract a significant inhibition of the spontaneous proliferation of RPMI-8866 cell line was detected (P<0.05)\(^{(165)}\).

The bioactive compounds isolated from seeds of Citrus aurantifolia were found to possess the potential of inhibiting human pancreatic cancer cells. While the compounds purified from peel had the potential of suppressing the colon cancer cells. The purified compounds from seeds exhibited significant inhibition of Panc-28 cells with IC\(_{50}\) values in the range of 18.1-100 µM, which was confirmed by viable cell count. DNA fragmentation and expression of proteins in cells treated with compounds showed the induction of apoptosis through p53 and caspase-3 mediated pathway. The volatile oil showed 78% per cent inhibition of human colon cancer cells (SW-480) with 100 µg/ml concentration at 48 h. Lime volatile oil showed DNA fragmentation and induction of caspase-3 up to 1.8 and two folds after 24 and 48 h, respectively\(^{(71)}\).

Citrus aurantifolia fruit volatile oil showed 78% inhibition of human colon cancer cells (SW-480) with 100 µg/ml concentration at 48 h. Lime volatile oil showed DNA fragmentation and induction of caspase-3 up to 1.8 and 2- folds after 24 h and 48 h, respectively. Analysis of apoptosis-related protein expression further confirmed apoptosis induction by lime volatile oil\(^{(166)}\).

The genotoxic effect of the crude volatile oils (0.005, 0.010, 0.025, 0.050, 0.075, 0.1 ppm) of Citrus limon fruit peels was investigated through estimation of mitotic index (MI) and blast index (BI) in human lymphocytes after treatment with prepared concentrations. The results showed that volatile oils from matured and non matured lemon peels possessed genetic effect by increasing MI and BI value of treated lymphocytes. It also appeared that volatile oils stimulated increasing the production of lymphocytes but with more than synergistic treatment with (PHA). Otherwise, It was also found that volatile oils exerted toxic effects against lymphocytes viability\(^{(167)}\).

The antimutagenicity and anticancer effect of Citrus medica fruit juice were evaluated on human astrocytoma cancer cells cultured in DMEM (Gibco), cancer cell line were treated by half-ripe and ripe Citrus medica fruit juice and cellular vital capacity was determined by MTT. The Citrus medica fruit juice was subsequently evaluated in terms of antimutagenicity and anticancer properties by a standard reverse mutation assay (Ames Test) which was performed with histidine auxotrophic strain of Salmonella typhimurium (TA100). By MTT, human astrocytoma cell line revealed a meaningful cell death when compared with controls (P<0.01). In Ames Test, the fruit juice prevented the reverted mutations and the hindrance percent of half-ripe Citrus medica was 71.7% and ripe Citrus Medica was 34.4% in antimutagenicity test and this value in anticancer test was 83.3% and 50% in half-ripe Citrus medica and ripe Citrus medica respectively\(^{(168,169)}\). C. limetta root extract at the concentration of 500 µg/ml was found to be lethal towards the larvae of brine shrimp (Artemia franciscana) in a study conducted in the Amazonas state of Brazil, which can serves as a pre-screen to existing cytotoxicity and antitumor assays\(^{(170)}\).

The antitumor activity of methanol extract of peel of Citrus limetta fruits (MECL) was evaluated against Ehrlich ascites carcinoma (EAC) cell line in Swiss albino mice. Twenty-four hours after intraperitoneal inoculation of tumor EAC cells in mice, MECL was administered at 200 and 400 mg/kg bw, i.p daily for nine consecutive days. On the 10\(^{\text{th}}\) day, half of the mice were sacrificed for the estimation of tumor growth (tumor volume, viable and non-viable tumor cell counts), and hematologic parameters (red blood cells, white blood cells and hemoglobin). The rest animals were kept alive for assessment of survival parameters (median survival time and percentage increase in life span of EAC bearing mice). Intraperitoneal administration of MECL at the doses of 200 and 400 mg/kg for nine days to the carcinoma induced mice demonstrated a significant (P<0.001) decrease in tumor volume, viable tumor cell count, tumor weight and a significant (P<0.001) improvement in hematologic parameters and life span as compared to the EAC control mice. The results establishes marked and dose dependant antitumor effect of Citrus limetta fruit peel against Ehrlich ascites carcinoma bearing Swiss mice\(^{(171)}\).

Limonene, one of the main constituents of citrus species fruit, reduces the risk of mouth, skin, lung, breast, stomach and colon cancer. Hesperidin, and its flavone analogue, diosmin, also exerted anti-carcinogenic activities in various in vivo studies. The polymethoxylated flavones have shown strong anti-proliferative action against cancer cells and antigen activated T-lymphocytes. Beta-cryptoxanthin (an orange-red carotenoid) inhibited development of lung cancer\(^{(172,173)}\).

A study of the inhibitory effects of two limonoid aglycones (limonin and nomilin) on the formation of benzo[a]pyrene induced neoplasia in the fore stomach of ICR/Ha mice showed that incidence of tumors was reduced by more than 50% at 10mg/dose\(^{(174)}\).
The cytotoxicity of hesperidin from the peel of *Citrus sinensis* was evaluated against different human carcinoma cell lines (larynx, cervix, breast and liver carcinoma cell lines). The results revealed that hesperidin exhibited pronounced anticancer activity against the selected cell lines. IC₅₀ were 1.67, 3.33, 4.17, 4.58 μg/ml, respectively.\(^{(147)}\)

**Central nervous effects:**

Preliminary behavioral screening performed with the lemon fruit demonstrates that it promoted sleep in dementia increasing motivational behaviour and improving disturbed behavior\(^{(175-176)}\). The central nervous system (CNS) depressant and anticonvulsant activities of *Citrus limon* essential oil (EO) were investigated in animal models. The EO (50, 100 and 150 mg/kg) administered by oral route in mice caused a significant decrease in the motor activity of animals when compared with the control group, up to thirty days after the administration and the dose of 150 mg/kg significantly reduced the remaining time of the animals on the Rota-rod apparatus. Additionally, *C. limon* essential oil was also capable to promote an increase of latency for development of convulsions induced by pentylentetrazole. The administration of flumazenil, (10 mg/kg, ip), GABAₐ-benzodiazepine (GABA-BZD) receptor antagonist, antagonized the effect of *C. limon* essential oil at higher dose. *C. limon* essential oil was also capable to promote an increase of latency for development of convulsions induced by picrotoxin at higher dose. In the same way, the anticonvulsant effect of the EO was affected by pretreatment with flumazenil, a selective antagonist of benzodiazepine site of GABAₐ receptor\(^{(177)}\).

The effects of apigenin, a bioflavonoid widely found in citrus fruits, on behavioral changes and inflammatory responses induced by chronic unpredictable mild stress (CUMS) was investigated in rats. When GW9662, a selective peroxisome proliferator-activated receptor gamma (PPARγ) inhibitor, administered 30min before apigenin, apigenin (20mg/kg, intragastrically) for three weeks remarkably ameliorated CUMS-induced behavioral abnormalities, such as decreased locomotor activity and reduced sucrose consumption. In response to oxidative stress, the NLRP3 inflammasome was activated and IL-1β secretion increased in the prefrontal cortex (PFC) of CUMS rats. However, apigenin treatment upregulated PPARγ expression and downregulated the expression of NLRP3, which subsequently downregulated the production of IL-1β. In addition, GW9662 diminished the inhibitory effects of apigenin on the NLRP3 inflammasome. Accordingly, the results demonstrated that apigenin exhibited antidepressant-like effects in CUMS rats, possibly by inhibiting IL-1β production and NLRP3 inflammasome expression via the up-regulation of PPARγ expression\(^{(178)}\). Anxiolytic and antidepressant effects and acute toxicity of ethanolic extract (EE) of the aerial parts of *Citrus limon* were studied in mice. Anxiolytic activity was evaluated using open field and elevated plus-maze tests. The antidepressant effect of the extract was studied by forced swimming test in mice. In the open field test, the oral route administration of EE alone showed significant sedative and antidepressant activities in mice (p < 0.05). EE did not alter motor coordination. The EE, at three doses tested, showed antidepressant effect and produced decrease in immobility time. The authors concluded that the EE of the aerial parts of *C. limon* have a sedative effect, which may be mediated by benzodiazepine-type receptors, and also an antidepressant effect where noradrenergic and serotonergic mechanisms will probably play a role\(^{(179)}\).

The effect of *Citrus limon* on memory of mice was studied using Harvard Panlab Passive Avoidance response apparatus controlled through LE2708 Programmer. Passive avoidance was fear-motivated tests used to assess short or long-term memory of small animals, which measures latency to enter into the black compartment. Animals with *Citrus limon* treatment showed significant increase in latency to enter into the black compartment after 3 and 24 hours than control\(^{(180)}\).

The sedative, anxiolytic and antidepressant effects of essential oil (EO) of leaves from *Citrus limon* were investigated in mice. The effects of EO were demonstrated by open-field, elevated-plus-maze, rota rod, pentobarbital-induced sleeping time, and forced swimming tests in mice. In the open-field test, EO at the doses of 50, 100 and 150 mg/kg, after oral administration, significantly decreased the number of crossings, grooming, and rearing. In the elevated-plus-maze (EPM) test, EO increased the time of permanence and the number of entrances in the open arms. On the contrary, the time of permanence and the number of entrances in the closed arms were decreased. In the rota rod test, EO did not alter motor coordination and, thus, was devoid of effects, as related to controls. In the pentobarbital-induced sleeping time test, EO at the same doses significantly increased the animals sleeping time duration. Since EO, at the doses of 50, 100 and 150 mg/kg, did not show a sedative effect in the open field test, these three doses when used in the forced swimming test, they were producing a decrease in the immobility time, similarly to that of imipramine (positive control). However, the antidepressant effects of EO were not altered by the previous administration of paroxetine. In addition, effects of EO in the forced swimming test were totally blocked by reseprine pretreatment\(^{(181)}\).

The behavioral effects of *Citrus limon* juice was studied in rats at three different doses (0.2, 0.4 and 0.6 ml/kg), considered as low, moderate and high doses. Anxiolytic and antidepressant activities were specifically assessed twice during 15 days using open field test, elevated plus maze and forced swimming test. In open field test
*Citrus limon*, revealed increase in distance travelled, number of central entries and number of rearing's at moderate dose, while in the elevated plus maze, number of open arm entries were found to be increased. Whereas in forced swimming test, there was decrease in duration of immobility and increase in duration of climbing\(^{182}\).

Factors that enhance the intrinsic growth potential of neurons play a major role in the regeneration and repair of adult neurons following an injury. Fibroblast growth factor (FGF-2) is one of the key players in the origin and growth of neuronal and glialcells through autocrine and paracrine signaling. Water extract of *Citrus medica* var. sarcodactylis, was found to activate the FGF-2 promoter in transgenic luciferase expression models. *Citrus medica* treatment on Schwann cells (RSC96) transfected with luciferase reporter plasmid under a FGF-2 promoter, was found to induce the FGF-2 promoter and showed enhanced luciferase expression. The FGF-2 expression was accompanied with an increase in the expression of proteins involved in cell migration and cell proliferation in a dose dependent manner\(^{183}\).

The effects of *Citrus sinensis* essential oil was evaluated in the elevated plus-maze followed by the light/dark paradigm in rats. The animals were exposed to the orange aroma (100, 200 or 400 microl) for 5 min, while in a Plexiglas chamber and were then immediately submitted to the behavioural tests. At all doses, *C sinensis* oil demonstrated anxiolytic activity in at least one of the tests and, at the highest dose, it presented significant effects in both animal models, as indicated by increased exploration of the open arms of the elevated plus-maze (time: p=0.004; entries: p=0.044) and of the lit chamber of the light/dark paradigm (time: p=0.030). In order to discard the possibility that this outcome was due to non-specific effects of any odour exposure, the behavioural response to Melaleuca alternifolia essential oil was also evaluated, using the same animal models, but no anxiolytic effects were observed\(^{184}\).

**Antidiabetic effect:**

To study the hypoglycemic effect of hexane extract of *Citrus limon* peel, diabetes was induced in rats by a single intraperitoneal injection of alloxan (140mg/kg bw). Hexane extract (200mg/kg bw) of *Citrus limon* peel was administered orally, while metformine hydrochloride (175 mg/kg bw) was used as a standard drug. The results showed that hexane extract exerted significant hypoglycemic activity and the activity of extract was comparable to that of standard drug\(^{185}\).

The effect of oral treatment with citrus peel extracts on wound repair of the skin was studied in diabetic rats. The extracts were estimated for vitamin C and total carotenoid contents prior to animal study. Diabetes mellitus was induced in rats by intraperitoneal injection of a single dose of streptozotocin (STZ, 75 mg/kg bw). One week after diabetes induction, full thickness excision wounds were made in hyperglycemic rats. The different test groups were treated with different citrus peel extracts orally at the dose of 400 mg/kg bw daily for 12 days. The blood glucose, body weight and rate of wound closure of each rat were measured every 3rd day during the experimental period. At the end of experiment, granular tissues of wounds were removed and estimated for hydroxylproline and total protein content. The results showed significant reduction in blood glucose and time to wound closure. Tissue growth and collagen synthesis were significantly higher as determined by total protein and hydroxyproline content\(^{186}\).

Measurements of the effects of *Citrus medica* cv Diamante peel extract on the mouse insulinoma MIN6 β-cells indicated that it exerted direct stimulatory effects on the exocytotic release of insulin in a concentration-dependent manner. *Citrus medica* cv Diamante peel extract reduced plasma glucose concentration in mice\(^{187}\).

The antidiabetic and hypolipidemic activity of petroleum ether extract of *Citrus medica* seeds was studied in streptozotocin (STZ) induced diabetic model in rats. Seed extract was given as (200 and 400 mg/kg, po.) The petroleum ether extract of *Citrus medica* seeds induced significant reduction (p < 0.05) of fasting blood glucose, serum cholesterol, serum triglycerides, LDL and VLDL in dose dependent manner after 15 days of drug administration. However, 200 mg/kg/day seed extract for 15 days was not showing any change in HDL level, while 400 mg/kg/day dose significantly increased HDL level in diabetic rats\(^{187}\).

**In vivo** hypoglycemic, and antidiabetic activity of *Citrus medica* L. var. *Sarcodactylis* were confirmed in Sprague-Dawley-SPF rats and Wistar DIO rats. Insulin secretagogue effect of *Citrus medica* L. var. *Sarcodactylis* Hort fruits was confirmed by kinetic analysis on the hypoglycemic patterns of the intraperitoneal glucose tolerance and the insulin-glucose tolerance tests\(^{188}\).

The antihyperglycemic activity of methanol extract of *Citrus limetta* fruit peel (MECL) was evaluated in streptozotocin-induced (STZ; 65 mg/kg bw) diabetic rats. Three days after STZ induction, diabetic rats received MECL orally at 200 and 400 mg/kg bw daily for 15 days. Glibenclamide (0.5 mg/ kg po) was used as reference drug. Blood glucose levels were measured on 0, 4th, 8th, and 15th days of study. Serum biochemical parameters namely, SGOT, SGPT and ALP were also estimated. The TBARS and GSH levels of pancreas, kidney, and liver were determined. MECL significantly (P<0.001) and dose dependently normalized blood glucose levels and serum biochemical parameters, decreased lipid peroxidation, and recovered GSH as compared to those of STZ control\(^{189}\).
The inhibitory effect of the aqueous *Citrus limetta* peel extract on the metabolism of carbohydrates was studied. The extract inhibited primarily the enzyme α-amylase by 49.6% at a concentration of 20 mg/ml and to a lesser extent the enzyme α-glucosidase with an inhibition of 28.2% at the same concentration. This inhibition was likely due to the high polyphenol content in the *Citrus limetta* peel (19.1 mg GAE/g). Antioxidant activity of the *Citrus limetta* peel demonstrated dose-dependent antioxidant activity, varying from 6.5% at 1.125 mg/ml to 42.5% at 20 mg/ml. The results showed that these polyphenolic compounds having both antihyperglycemic and antioxidant activities.

The anti-diabetic potential of orange peel and juice was attributed to anti peroxidation, inhibition of α-amylase enzyme activity responsible for the conversion of complex carbohydrates to glucose, increased hepatic glycogen content, stimulation of insulin secretion, and repair of secretory defects of pancreatic β-cells.

The effects of four different concentrations of peel extract from *Citrus sinensis* (CS) were investigated in male mice, the results revealed that they exerted glucose lowering and antiperoxidative activities. In a separate experiment their potential was evaluated with respect to the regulation of alloxan induced diabetes mellitus. While a single dose of alloxan (120 mg/kg) increased the serum levels of glucose and alpha-amylase activity, rate of water consumption and lipid peroxidation (LPO) in hepatic, cardiac and renal tissues with a parallel decrease in serum insulin level, administration of 25 mg/kg of CS was found to normalize all the adverse changes induced by alloxan, revealing the antidiabetic and anti peroxidative potential of tested fruit peel extracts.

**Antinflammatory and analgesic effects:**

The inhibitory effect of pectin at different degrees of esterification (DEs) on the expressions of inducible nitric oxide synthase (iNOS) and cyclooxygenase-2 (COX-2) in lipopolysaccharide (LPS)-activated macrophages was investigated. Western blot and RT-PCR analyses demonstrated that 30% esterified pectin (DE30), DE60 pectin, and DE90 pectin significantly inhibited the protein and mRNA expressions of iNOS and COX-2 in LPS-activated macrophages, and DE90 pectin was the most-potent inhibitor. To clarify the mechanisms involved, DE90 pectin was found to inhibit the phosphorylation of MAPKs and IKK kinase activity. In addition, DE90 pectin inhibited the activation of NF-κB and AP-1 by electrophoretic mobility shift assay and transient transfection experiments. DE90 pectin bind with LPS, and might result in decreasing binding of LPS to its receptor.

Orally, *Citrus limon* essential oil (EO) (50, 100, and 150 mg/kg) significantly reduced the number of writhes, and, at highest doses, reduced the number of paw licks. Naloxone antagonized the antinociceptive action of EO (highest doses), this suggested, at least, the participation of the opioid system.

The ethanolic extract of peels of *Citrus sinensis* (CS) were investigated on carrageenan induced inflammatory pain in rats. Anti-inflammatory activity was assessed by measuring paw volume in rats. Analgesic activity was evaluated for its central and peripheral pharmacological actions by using hot plate, plantar, pin prick and mechanical allodynia tests in rats. EtCM (400 mg/kg) produced significant analgesic and anti-inflammatory effects.

The analgesic effect of fresh decoction of *Citrus medica* fruits was studied in rats. The decoction was prepared from fresh fruits in distilled water and the volume was reduced to 1/4. Three doses of decoction (1, 2 and 4ml/kg po) were tested for analgesic activity using tail immersion method and hot plate method. Diclofenac sodium (10mg/kg ip) was used as standard. The decoction at doses (2 and 4ml/kg) showed significant increase in latency to flick compared to control in tail immersion method. Whereas the decoction of *Citrus medica* at all three doses showed significant increase in the mean basal reaction time in hot plate method. In both methods, analgesic effect of 4ml/kg decoction was observed comparable to the standard drug.

Methanol extracts of peel of *Citrus limetta* fruits (MECL) were evaluated in two dose levels (200 and 400 mg/kg) in histamine, carrageenan and dextran induced acute rat paw oedema models for their anti-inflammatory potential. MECL was able to significantly (p<0.001) reduce the inflammatory potential produced by different inflammatory mediators in a dose dependant manner. MECL was able to produce significant anti-inflammatory activity better than the reference drug used (phenylbutazone 100 mg/kg bw po). Carotenoids,
zeaxanthin and beta-cryptoxanthin, were the phytonutrients of *Citrus sinensis* which reduce remarkably the risk of rheumatoid arthritis. Persons consuming high amount of zeaxanthin and cryptoxanthin showed 52% less chances of developing rheumatoid arthritis.[65]

The effect of orange juice on cellular modifications induced by a fatty meal was investigated. 18 apparently healthy subjects consumed a fatty meal, during which they drank orange juice, either blond or red, or water, according to a randomized cross-over design. Two hours after the end of the fatty meal, both white blood cell (WBC) and platelet counts significantly increased (12.5 and 5%, respectively), while mean platelet volume decreased and a 25% release of myeloperoxidase (MPO) from polymorphonuclear leukocyte occurred. Both juices significantly prevented WBC increase and MPO degranulation, in respect to control. Triglycerides significantly increased (42%) after the fatty meal, but at a lower extent when red orange juice was consumed with the meal (20%), in respect to blond orange juice or control. This effect was statistically significant in the subgroup subjects with hypertriglyceridemia. Vascular stiffness (augmentation index), measured by Endo-PAT2000, significantly decreased after the meal only in conjunction with red orange juice. Accordingly, in healthy subjects the concomitant intake of orange juice may prevent the low-grade inflammatory reaction induced by a fatty meal, at cellular and possibly at vascular function levels.[199]

Ultraviolet light (UV) induced an inflammatory response in the skin by cyclooxygenase (COX)-2 expression and prostaglandin PGE₂ production. Orange peel which contained polymethoxyflavonoids (PMFs) as a major ingredient, which have anti-inflammatory activity, has been used as a natural medicine. The extract suppressed UVB-induced COX-2 expression and PGE₂ production in HaCaT cells. Furthermore, the extract acted as a peroxisome proliferator-activated receptor (PPAR)-γ agonist. The suppression of UVB-induced COX-2 expression by this extract was inhibited by GW 9662 and T0070907, which were both PPAR-γ antagonists. It was therefore suggested that orange peel extract, containing high levels of PMFs, suppresses UVB-induced COX-2 expression and PGE₂ production through PPAR-γ.[200]

**Reproductive effects:**

Studies have shown that lime juice destroys sperm cells, fifty percent of *Citrus aurantifolia* juice wiped out 2000 of sperm cells in 30 seconds. The high acidity of *Citrus aurantifolia* juice may probably responsible for this destruction.[123] The effect of lime juice was studied on the fetal parameters of Sprague-Dawley rats. The estrous cycles of the female rats were studied for the first 16 days to establish cyclicity. The rats were mated with male SD rats of proven fertility on the estrous day (heat period) of estrous cycle. Rats in group I received 1ml of undiluted lime juice while rats in group II received distilled water by gastric gavage. The rats were sacrificed on the 20th day of pregnancy and fetal parameters were evaluated. There was a reduction in the number of fetus of treated pregnant rats when compared to the control. There was a significant reduction in the crown-rump length, weight and umbilical cord length of the fetus when compared with the control.

Accordingly, lime juice showed abortifcient effect but no obvious teratogenic effect was observed.[123]

The anti fertility effect of *Citrus limonum* seeds was studied on male rats. Male albino rats were orally treated with alcoholic extract and its fractions for 30 and 60 days. Testis and epididymis were removed and tested for sperm count, sperm motility, sperm morphology in addition to histopathological examination. sperm counts were also studied 90 days after discontinuation of the treatment to see reversibility of effect. 60 days treatment significantly decreased the sperm count. Size and weight of testis and epididymis were reduced indicating atrophic changes in testis and epididymis. It caused drastic effect on sperm motility and morphology which decreased fertility. Sperm counts returned to normal after 90 days.[201]

The petroleum ether, alcoholic and aqueous extracts of *Citrus limonum* seeds were investigated for anti-fertility effect in female albino mice. The extracts were administered orally for 7 days after insemination (i.e. post-ovulatory test). The control group received 4% gum acacia. The animals were examined for implantation sites on 10th day of pregnancy. The number of pups delivered at term was recorded for each group. The alcoholic extract showed significant anti-fertility effect as compared to petroleum ether and aqueous extracts. The alcoholic extract was subjected for fractionation and the fractions were again tested for their anti-fertility effect. The fraction of ethyl-acetate showed most encouraging anti-fertility activity. In second part of the study, the alcoholic extract and its ethyl-acetate fraction were subjected to evaluation of their mechanism of action and it was found that their principal mode of action is as an anti-zygotic agent. Withdrawal of the treatment, resulted in complete restoration of fertility.[202]

Estrogenic /anti-estrogenic activities of alcoholic extract of *Citrus limonum* seeds was studied in Albino rats. The standard drug estrogen was given sub-cutaneously and test drug, alcholic extract of lemon seeds was given orally for 7 days from 8th to 14th days of ovariecmised rats. The extract treated rats exhibited estrogenic effect, which include vaginal epithelium cell cornification and increased in uterine weight. For further supporting the estrogenic activity of the extract, isolated rats uterus preparation was mounted, and it showed that alcoholic extract of lemon seeds produced the contraction as pretreatment with stilbistro[203].

Three extracts of the peels of *Citrus medica* including oil, ethanolic and chloroform extract were investigated for antifertility activity. The alcoholic extract at the dose of 2.5gm/kg and the chloroform extract at
Nutritional value and pharmacological importance of citrus species

dose of 1.0 gm/kg on female wistar rats on days 1-7 post-coital, exhibited significant anti-implantation activity. While, the oil extract at the dose of 100mg/kg on days 1-7 didn’t exhibit significant anti-implantation activity

Petroleum ether extract of Citrus medica seeds, was administered orally (400 mg/kg body weight) for 30 days to study its effect on fertility in Wistar strain Albino rats. Animal were divided into 3 groups: Group I, received 400mg petroleum ether extract/kg in 0.2ml Tween-80 (1%) orally for 30 days. Group-II, received only 0.2ml Tween-80 (1%)/kg for 30 days and left untreated for another 30 days to served as control. Group-III: received 400mg petroleum ether extract/kg in 0.2ml Tween-80 (1%) for 30 days and left untreated for next 30 days to see the withdrawal effects. The results were analysed depending on gravimetric, histological, histometric and biochemical parameters. Histologically, ovary and uterus in extract treated rats showed reduced number of healthy follicles, regressing follicles and also elevation in corpora lutea in the Group I and II. For the study of withdrawal effects of this extract in Group III, the results indicated that the animals returned to normal and regained gonadotrophin secretion similar to that of control rats.

Petroleum ether, benzene and ethanol extracts of the seeds of Citrus medica were administered orally at the dose level of 200 and 400 mg/kg to adult female albino rats for 30 days. The estrous cycle of these rats was irregular with prolonged proestrus and estrous, reduced metestrus and diestrus phase during the experimental period. At autopsy on day 31st, petroleum ether extract treated rats showed reduced ovarian weight, benzene extract treated rats showed increased ovarian weight and ethanol extract treated rats showed non-significant change in the weight of ovary. Histological changes of the ovary indicated increases in the number of atretic follicles but decreases in the number of healthy developing follicles, Graafian follicles and corpora lutea. The total cholesterol, activity of acid and alkaline phosphatase and ascorbic acid content of the ovary were increased, whereas, protein and glycogen content were decreased. The uterine weight and its micrometric measurements in the treated rats were increased significantly. However, petroleum ether extract of Citrus medica seeds was more effective in causing these changes comparing to other extracts.

Estrogenic/anti-oestrogenic activities of petroleum ether extract of Citrus medica seeds were studied in albino rats. The extract at the dose level of 200 and 400 mg/kg body weight was administered for seven days to immature ovariectomised rats, along with or without 1 μg ethinyl estradiol. The extract-treated rats exhibited estrogenic effects, which included increase in uterine weight and vaginal epithelial cell cornification. The micrometric measurements of the uterus and its components were increased and glands showed high secretory activity. When the extract was tested in 30-day-old immature rats, they exhibited opening of vagina on the fifth day and cornification of vaginal epithelial cells, which was about 10 days earlier compared to controls, which further supporting the estrogenic activity of the extract. Hence, these results strongly indicate the potent estrogenic nature of petroleum ether extract of Citrus medica seeds.

The estrogenic activity of petroleum ether extract of Citrus medica leaves was studied in immature female rats. The petroleum ether extract proved to retain high estrogenic activity in immature female rats. Oral administration of petroleum ether extract of Citrus medica in ovariectomized immature female Wistar rats for 7 days in a dose of 400 mg/kg resulted in significant increase in the uterine weight (g) (1.7±0.11) when compared with ovariectomized control rats (1.3±0.07).

Gastrointestinal effect:
The antiulcer activity of aqueous extract of the fruits of Citrus medica was evaluated against ethanol-induced ulcers in rats. The rats were pretreated with the extract at two doses (250 and 500 mg/kg po) and the antiulcer effect was compared with that of ranitidine (20 mg/kg po). The extract of both doses showed a significant reduction in ulcer formation. Histopathological sections showed significant decrease in mucosal ulceration, inflammatory mucosal changes and submucosal edema compared to ethanol treated group and the ranitidine group. It was concluded that, the fruits of Citrus medica possesses significant antiulcer activity against ethanol-induced ulcers in rats and the antiulcer activity could be due to the presence of flavonoids as these compounds have well documented antiulcer activity.

Respiratory effect:
A study among British children found a positive association between fresh fruit consumption and the level of forced expiratory volume in one second (FEV1). The association was more pronounced in wheezers than non-wheezers. An Italian study, followed over 18,000 children aged 6-7 years and found that those eating the most citrus fruit (oranges, tangerines, and grapefruit), along with kiwifruit, had a reduced risk of wheezing. The protective effect of citrus did not appear to be dose related. The authors attributed the lung health benefiting properties of citrus and kiwifruit to their high concentration of vitamin C.

Dental effect:
The effects of Citrus aurantifolia (CA) extract was studied on smear layer removal in different parts of root canals. Thirty-nine single-rooted human teeth were randomly divided into three experimental and one
control groups. Teeth were instrumented using MTwo rotary instruments. Root canals were irrigated with NaOCl during instrumentation. The canals in each group were irrigated with one of the following: completed mixture of *Citrus aurantifolia* extracts, 17% EDTA, and alcoholic extract of CA. Distilled water was used for the control group. The irrigants were left within the canal for 20 minutes, and then rinsed with normal saline solution. Teeth were subsequently split longitudinally into 2 halves, and the canals were examined by a scanning electron-microscope. Cleanliness was evaluated using a five point scoring system. Statistical significant difference was found between groups (P<0.05). The smear layer was more effectively removed with 17% EDTA compared to alcoholic CA extract. However, they were both able to remove the smear layer in the coronal segment. Completed CA extract removed more smear layer in coronal and middle parts compared with the alcoholic extract (P=0.001); however, there was no significant difference in the apical part (212).

**Antiallergic and immunological effect:**

Gencydo®, a combination of *Citrus limon* juice and aqueous quince (*Cydonia oblonga*) extract has been used traditionally in anthroposophical medicine for treating patients with allergic rhinitis or asthma. The anti-allergic effects of this preparation was investigated in vitro by using cell lines and primary cells in various biological and immunological endpoints. The release of soluble mediators from basophilic cells, mast cells and lung epithelial cells, which were essential for the initiation of early- and late-phase allergic reactions, was analyzed in relation to the synthetic anti-allergic drugs azelastine and dexamethasone. In addition, the impact of Gencydo® on the viability and activation of GM-CSF-activated eosinophil granulocytes was investigated. Gencydo® reduced the degranulation and histamine release of IgE-activated basophilic cells and mast cells and inhibited the IgE- and PMA/A23187-induced increases in IL-8, TNF-α and GM-CSF production in mast cells. The effects were comparable to that of azelastine and dexamethasone. Furthermore, Gencydo® partially blocked eotaxin release from human bronchial epithelial cells, but has no impact on the viability and activation of GM-CSF-activated eosinophil granulocytes. The results gave a rational base for the topical use of Gencydo® in treatment of allergic disorders through the down regulation of soluble mediators, which were essential for the initiation and maintenance of allergic reactions (213).

The effects of the combined *Citrus medica* ssp. *limonum /Cydonia oblonga* (0.01 g/ml of each one), separate products of *Citrus medica* ssp. *limonum* (0.01 g/ml) and *Cydonia oblonga* (0.01 g/ml) were investigated on the immunological pathways involved in seasonal allergic rhinitis (SAR). Peripheral blood mononuclear cells (PBMCs) from five healthy and five grass pollen allergic donors were isolated and analyzed in vitro after polyclonal and allergen-specific stimulation of T cells in the presence of the three extracts. The analyses demonstrated acceptable cell survival with no signs of toxicity. Citrus mainly had a selective effect on reducing allergen-specific chronic inflammatory (TNF-α; Citrus compared to Cydonia and Citrus/Cydonia: −87.4 (P<0.001) and −68.0 (P<0.05), resp.) and Th2 pathway activity (IL-5; Citrus compared to Cydonia: −217.8 (P<0.01); while, both Cydonia and Citrus/Cydonia mainly affected the induction of the allergen-specific Th1 pathway (IFN-γ; Cydonia and Citrus/Cydonia compared to Citrus: 3.8 (P<0.01) and 3.0 (P<0.01), respectively). Citrus and Cydonia demonstrated different working mechanisms in the treatment of SAR and the combination product did not demonstrate larger effects than the separate preparations (214).

The immunomodulatory and antiallergic properties of preparations from lemon, *Citrus medica* L. (*citrus*), and *Cydonia oblonga*, which were used in pharmaceutical products to treat patients suffering from allergic disorders, were investigated. Preparations were analyzed with respect to their impact on the degranulation capacity from basophilic cells as well as mediator release from activated human mast cells in vitro, including IL-8 and TNF-α secretion. The results showed that the degranulation of basophilic cells was diminished only in the presence of Citrus. Furthermore, Citrus and Cydonia both inhibited the production of IL-8 and TNF-α from human mast cells, and at low concentrations additive effects were observed (215).

To compare the efficacy and safety of two routes of administration (nasal spray versus subcutaneous injections) of Citrus/Cydonia in seasonal allergic rhinitis, a randomised, comparative clinical trial with two parallel groups was carried out. After a one- or two-week wash-out period, 23 patients were randomized, to a 6-week treatment period and the immunological and symptom severity changes and safety were evaluated. Both routes of administration were safe, they demonstrate therapeutic immunological and clinical effects (216).

**Effect on body weight:**

The effects of *Citrus aurantifolia* essential oils in reducing body weight, individually and in co-administration with ketotifen, an antihistaminic drug that causes weight-gain, has been investigated using mice model. During the 45 days experimental period, the mice that received ketotifen demonstrated an enhancement both in the amount of food intake and body weight compared to the control group. Groups treated with *Citrus aurantifolia* essential oil displayed reduction in body weight and food consumption, possibly through promoting anorexia which might have played a role in weight loss. Interestingly, co-administration of the *Citrus aurantifolia* essential oil and ketotifen caused significant suppression in gaining weight, as well as decreased

96
Nutritional value and pharmacological importance of citrus species

body weights of mice. The results suggested that *Citrus aurantifolia* essential oil played an important role in weight loss and could be useful in treatment of drug-induced obesity and related diseases\(^{(217)}\).

**Effect on bone loss:**

The efficacy of *Citrus aurantifolia* cv. Swingle and *Citrus sinensis* cv. Liuchen against osteoporosis was evaluated in an ovariectomized rat model. Administration of *Citrus* extracts increased trabecular bone mineral content and bone mineral density of tibia, improved the levels of phosphorus and calcium. The results demonstrated that *Citrus* extracts reduced bone loss in ovariectomized rats\(^{(218)}\).

**Anti-cholinesterase effect:**

The anti-cholinesterase activity of *Citrus aurantifolia* peel and leaves from different areas of growth, was studied. \(n\)-Hexane fractions of both peel and leaves showed a good acetylcholinesterase inhibitory activity with IC\(_{50}\) values in the range 91.4-107.4 µg/ml\(^{(217)}\).

**Xanthine oxidase inhibitory effect:**

Among the many extracts tested, the *Citrus limetta* peel extract exhibited highest potency of xanthine oxidase inhibition (IC\(_{50}\) = 40.16±0.88µg/ml)\(^{(219)}\).

**Decreasing the risk of renal stone:**

It was recorded that when women drank 1/2 liter of orange juice daily, their urinary pH value and citric acid excretion increased thereby diminishing the risk of forming calcium oxalate stones significantly\(^{(220)}\).

**Feeding value:**

A feeding trial was conducted with thirty six mixed breeds of rabbits to assess the feeding value of sun dried sweet orange (*Citrus sinensis*) fruit pulp meal (SOPM). The sweet orange peel meal was analyzed for its proximate nutrients and its crude fiber constituents. The experimental rabbits were randomly assigned to six dietary treatments: T0, T5, T10, T15, T20 and T25 in which SOPM replaced maize at 0, 5, 10, 15, 20 and 25%, respectively. The rabbits were fed these diets for 84 days during which performance and nutrient digestibility were evaluated. Experimental diets had significant effects (\(p<0.05\)) on the body weight gain, water intake, water: feed ratio, protein efficiency ratio and final live weight. Coefficient of digestibility and nutrient digestibility, were not adversely affected by the inclusion of SOPM in the diets. The results revealed the possibility that sweet orange fruit pulp meal can be used as a replacement feedstuff for maize in the ration of grower rabbit up to a level of 20%\(^{(221)}\).

**Effect on liver metabolism:**

The possible action of the *Citrus aurantium* extract on liver metabolism was investigated on isolated perfused rat liver. The isolated perfused rat liver was used to measure catabolic and anabolic pathways, including oxygen uptake and perfusion pressure. The *Citrus aurantium* extract and \(p\)-synephrine increased glycogenolysis, glycolysis, oxygen uptake and perfusion pressure. These changes were partly sensitive to \(\alpha\) and \(\beta\)-adrenergic antagonists. \(p\)-Synephrine (200 \(\mu\)M) produced an increase in glucose output that was only 15% smaller than the increment caused by the extract containing 196 \(\mu\)M \(p\)-synephrine. At low concentrations the *Citrus aurantium* extract tended to increase gluconeogenesis, but at high concentrations it was inhibitory, opposite to what happened with \(p\)-synephrine. The action of the *Citrus aurantium* extract on liver metabolism is similar to the well known actions of adrenergic agents and can be partly attributed to its content of \(p\)-synephrine. Many of these actions were catabolic and compatible with the weight-loss effects usually attributed to *Citrus aurantium*\(^{(222)}\).

**Protective effect:**

The cytoprotective effects of *Citrus aurantifolia* was evaluated against Aflatoxin B1 (AFB1)-induced liver injury in rat model. Wistar albino rats were divided into five groups. Group I served as the control. Group II treated with vessel, dimethyl sulfoxide (DMSO) a single intraperitoneally intraperitoneally on day 5. Group III received AFB1-alone (1mg/Kg body weight) intraperitoneally in DMSO as a single dose on day 5. Group IV and V received *Citrus aurantifolia* methanol extract (MeCA) and *Citrus aurantifolia* aqueous extract (AqCA) (500mg/Kg body weight, per oral) for 5 days and AFB1 (1mg/kg body weight) intraperitoneally in DMSO as a single dose on day 5. At the end of the 8\(^{th}\) day, the livers were collected and used to determine the hepatoprotective activity. Genomic DNA fragmentation was observed by agarose gel electrophoretic pattern in the rat livers. The ultra-structure of the liver cells was studied by electron microscopy. *Citrus aurantifolia* treatment significantly protected nucleic acid. The treatment was significantly inhibited DNA fragmentation. Nucleus structures were well maintained. The results demonstrate that *Citrus aurantifolia* has a cytoprotective effect against AFB1-induced liver injury\(^{(223)}\).
The ethanol extract of *Citrus limon* fruits was evaluated for its effects on experimental liver damage induced by carbon tetrachloride. The ethyl acetate soluble fraction of the extract of *Citrus limon*. fruits was evaluated on HepG2 cell line. The ethanol extract normalized the levels of aspartate aminotransferase, alanine aminotransferase, alkaline phosphatase, and total and direct bilirubin, which were altered due to carbon tetrachloride intoxication in rats. In the liver tissue, treatment significantly raised the levels of antioxidant enzymes superoxide dismutase and catalase. It improved the reduced glutathione (GSH) levels in treated rats in comparison with CCl₄-intoxicated rats. In the histopathologic studies, treated animals exhibited restoration of the liver architecture toward normal. Three doses of ethanol extract (150, 300, and 500 mg/kg) were evaluated. The results obtained were dose dependent, and the effect of the highest dose was almost equal to the standard silymarin. Significant reduction in cell viability was observed in cells exposed to CCl₄. A dose-dependent increase in the cell viability was observed when CCl₄-exposed HepG2 cells were treated with different concentrations of ethyl acetate soluble fraction of the ethanol extract. The highest percentage viability of HepG2 cells was observed at a concentration of 100 µg/ml. Ethylene glycol (0.75% v/v po in drinking water; 28 days) induced urolithiasis was used to study the protective effect of flavanoid rich fraction of *Citrus medica* (FFCM) at three dose level (320, 380 and 440 µg/kg - 28 days; po) in male wistar albino rats. Cystone (750 mg/kg; po) was used as standard drug. After completion of treatment period of 28 days, 24 hr urine sample and blood were collected. Various physical parameters like body weight, diuresis, pH, kidneys weight (wet and dry) were measured. Various stone forming inhibitors (magnesium and citrate) and promoters (oxalate, calcium, phosphate, uric acid and urea) were analysed in urine, serum and kidney homogenate. Renal function test (BUN and creatinine clearance), antioxidant parameters (MDA and catalase) and crystalluria were also evaluated. FFCM at all dose level significantly prevented EG induced changes in calcium, inorganic phosphate, uric acid, oxalate, urea, citrate, magnesium level; creatinine clearance and oxidative stress. FFCM possessed anti-lithic activity in experimentally induced urolithiatic model that can be attributed to its diuretic action, decrease in promoters and increase in inhibitors level as well as antioxidant potential.

The hepatoprotective activity of orange essential oils was evaluated in carbon tetrachloride-induced hepatotoxicity in rats. Orange essential oils significantly reduced the serum ALT level when compared to CCl₄ group, while it did not affect the serum AST level. The histopathological findings did not show any significant difference between the orange essential oils treated and CCl₄ groups.

**Toxicity and side effects:**

*Citrus aurantifolia*

All sources agree that citrus fruits contain d-limonene. Several sources demonstrate that oxidized d-limonene is allergic, whereas information on unoxidized d-limonene is conflicting. Several sources mention that citrus species contains 5-methoxyxypсорalene that is phototoxic.

The acute toxicity of *Citrus aurantifolia* indicated that doses up till 3g is safe. Acute and subchronic toxicities of the water extract from the roots of *Citrus aurantifolia* were studied in both male and female rats. Oral administration of the extract at a single dose of 5,000 mg/kg body weight did not produce signs of toxicity, behavioral changes, mortality or differences on gross appearance of internal organs. The subchronic toxicity was determined by oral feeding the test substance at the doses of 300, 600 and 1,200 mg/kg body weight for 90 days. The examinations of signs, animal behavior and health monitoring showed no signs of abnormalities in the test groups as compared to the controls. The test and control groups (on the 90th day) and the satellite group (on the 118th day) were analyzed by measuring their final body and organ weights, taking necropsy, and examining hematological parameters, blood clinical chemistry and histopathology features. The oral administration of 1,200 mg/kg/ day of the extract of *Citrus aurantifolia* in male and female rats caused a increase in the liver enzymes, which remained within the normal range, but did not produce a significant histopathological change in the internal organs. In conclusion, the extract from the roots of *Citrus aurantifolia* administered orally did not cause acute or subchronic toxicities to male and female rats.

The subchronic toxicity of *Citrus aurantium* was evaluated in mice. Mice received for 28 consecutive days a commercial *Citrus aurantium* dried extract (containing 7.5% p-synephrine) 400, 2000 or 4000 mg/kg and p-synephrine 30 or 300 mg/kg by oral gavage. There was a reduction in body weight gain of animals treated with both doses of p-synephrine. Organs relative weight, biochemical and hematological parameters were not altered in all treated mice. There was an increase in reduced glutathione (GSH) concentration in groups treated with *Citrus aurantium* 4000 mg/kg and p-synephrine 30 and 300 mg/kg. In glutathione peroxidase (GPx), there were an inhibition of the activity in *Citrus aurantium* 4000 mg/kg and p-synephrine 30 and 300 mg/kg treated animals, respectively, and there was no alteration in malondialdehyde (MDA) levels.

*Citrus limonum*

Essential oil of *Citrus limonum* is generally considered safe and devoid of adverse side effects when administered in recommended doses. The potential capacity of causing sensitisation effects is very weak.
Acute toxicity study of n-hexane extract of *C. limon* peel at 2000mg/kg body weight in mice for 14 days did not produce any mortality. There was no significant change in the body weight and food consumption of the animals. The animals did not show any signs of toxicity and resembled the normal animals, which indicated the safety of extract of *C. limon* peel in the experimental species.[185]

**Citrus medica**

The toxicity of *Citrus medica* leaves essential oil was studied in rats. The effect of chronic ingestion of a diet treated with different concentrations of essential oil of *Citrus medica* was studied on body weight, diet consumption, haemoglobin, total and differential leucocyte count, blood glucose, protein, cholesterol, urea levels and glutamic oxalacetic transaminase, glutamic pyruvic transaminase and alkaline phosphatase activity in albino rats. It was found that the *Citrus medica* oil was nontoxic to test animals and did not induce any adverse effects to the blood, liver function, kidney function, protein, carbohydrate and lipid metabolism of the animals.[231] The acute toxicity of the ethanol extract of the whole fruit of *Citrus medica* was evaluated in rats. Female rats received a single high dose of ethanolic extract of *Citrus medica* (2 g/kg orally) by gavage. The animals were observed for toxic symptoms continuously for the first 4 h after dosing. Finally, the number of survivors was noted after 24 h and these animals were then maintained for a further 13 days with daily observation. No toxicity symptoms (e.g., convulsions, myosis, mydriasis, diarrhea, increasing respiration, urination, and muscle relaxation) were recorded. The LD50 value by oral route could not be determined as no lethality was observed up to 2.0 g/kg of the *Citrus medica* in the animals.[155]

**Citrus sinensis**

Essential oil of *Citrus sinensis* is generally considered as safe and devoid of adverse side effects when administered in recommended doses. The potential capacity of causing sensitization and irritation effects is very weak. Human patch tests with orange essential oil eight per cent in petrolatum had no irritant reaction after 48 hours, no sensitization, and no phototoxic effects.[232]

**Conclusion:**

This review discuss the chemical constituent, pharmacological and therapeutic effects of *Citrus* fruits as promising nutraceutical because of its safety and effectiveness.
